RE: Geotechnical Investigation Report
Kentucky Transportation Cabinet (KYTC)
US 62 – Sympson Lake Dam (Item No. 4-5013.00)
Nelson County, Kentucky

Dear Mr. Scott,

The HDR Engineering, Inc. team is pleased to provide the accompanying Geotechnical Investigation Report, documenting the geotechnical exploration performed for the US 62 – Sympson Lake Dam project in Bardstown, Kentucky.

The geotechnical data presented within this report includes the typed boring logs, laboratory testing results, piezometer installation logs, piezometer readings collected to date, site photographs, and recommendations for next steps. It has been our pleasure to serve you on this very important project.

Please contact us if you have any questions or comments concerning this information.

Sincerely,

HDR Engineering, Inc.

Kevin Walker, PE (AL,GA,NC,PA,TX)
Senior Project Manager

Adam Hacker, PE
Area Dams, Levees & Civil Works Lead

Bryan Robbins, PE
Geotechnical Engineer

Drake Moulton, PE

1 Introduction

This document presents the geotechnical data obtained during the geotechnical investigation executed in accordance with the Proposed Boring Plan (also designated as the Drilling Plan herein) for the US 62 – Sympson Lake Dam project submitted on September 19, 2024, to representatives of the Kentucky Transportation Cabinet (KYTC). Following the submittal, the Drilling Plan was approved via email by KYTC, and it was acknowledged that field exploration could begin on October 14, 2024. This Geotechnical Investigation Report was prepared by HDR Engineering, Inc. (HDR) for KYTC. This geotechnical investigation was identified as a "Potential Next Step" during the 2022 Semi-Quantitative Risk Analysis (SQRA) to enhance confidence in subsurface conditions and support more targeted remediation efforts to mitigate ongoing embankment distress. At the end of this report, conclusions and recommendations are presented on the need for additional explorations, potential mitigation measures, and any changes in risk reduction requirements identified through the exploration since the SQRA.

2 Objective

The objective of this Geotechnical Investigation Report is to present the following data collected and assembled as part of the investigation:

- Typed boring logs
- Laboratory test results
- Piezometer installation logs
- Piezometer readings
- Investigation results plots versus depth
- Soil-bedrock profile sheets
- Photographs collected before, during, and after drilling
- Preliminary 3D subsurface model
- Recommendations for next steps

The geotechnical data in this report is based on on-site observations, field logging of borings, and laboratory testing of soil and bedrock samples. The samples were collected and tested in accordance with the KYTC Geotechnical Guidance Manual (KYTC, 2005), ER 1110-1-1807 (USACE, 2014), and EM 1110-1-1804 (USACE, 2001), using accepted methods and practices in compliance with ASTM standards and/or KYTC Kentucky Methods (KM) procedures, as applicable.

3 Project and Boring Locations

The project site is approximately 2.5 miles due west of the city of Bardstown in Nelson County, Kentucky. Sympson Lake was constructed as a water supply dam in 1963 when US62 was constructed over Buffalo Creek by the Kentucky Department of Highways. The dam is classified as a Significant or Class B, Moderate Hazard dam and is listed on the National Inventory of Dams (NID) under identification number KY00045. The project location in reference to Bardstown is shown in Figure 3-1 below.

Figure 3-1: Project Location US 62 – Sympson Lake Dam Project

3.1 Datum

This Geotechnical Investigation Report presents the boring and instrumentation coordinates based on the “NAD83 KY State Plane Single Zone” datum and coherent elevations based on the “North American Vertical Datum of 1988 (NAVD88)”.

3.2 Boring Locations

Appendix A of this report includes the Coordinate Data Form and the boring layout showing the as-drilled locations of the borings and installed instrumentation locations. In addition, Table 3-1 below provides coordinates from September 2024, for each corresponding as-drilled boring location per KY State Plane Single Zone Datum and NAVD88.

Table 3-1: Boring Locations (As-Drilled)

Boring ID	Location	Surface Elevation (NAVD88)	Northing (feet)	Easting (feet)
1001	Crest	533.6	3817387.5	4990515.7
1002	Crest	529.9	3817371.4	4990638.8
1003	Crest	528.7	3817352.8	4990762.2
1004	Crest	529.2	3817330.2	4990900.6
1005	Crest	529.8	3817310.8	4991024.3

1012	Crest	530.1	3817249.1	4991208.8

4 Geotechnical and Geological Conditions

4.1.1 Geological Setting

Sympson Lake is located within central Nelson County just west of Bardstown, Kentucky, and within the transitional boundary between the Outer Bluegrass and Knobs physiographic regions of Kentucky (Carey and Hounshell, 2008). The Outer Bluegrass region is a gently rolling lowland consisting of fertile soils, while the Knobs physiographic region forms a characteristic horseshoe-shaped boundary around the Outer Bluegrass region and consists of conical hills isolated from one another by broad stream valleys. Within Nelson County, topography ranges from nearly flat in Bardstown to highly dissected hills with local relief as much as 300 to 400 feet in the western portion of the county (McGrain and Currens, 1978). Topographic contours from the 7.5-minute Cravens quadrangle (Peterson, 1968) and recent state LiDAR from 2020 indicate a decrease in elevation along US-62, east of the project site down to the spillway.

The project site is underlain by the near-horizontally bedded Silurian-aged Laurel Dolomite, Osgood Formation, and Brassfield Dolomite, as well as the Ordovician-aged Drakes Formation (Peterson, 1968). The Laurel Dolomite primarily consists of dolomite with minor shale, while the Osgood Formation is composed of shale and dolomite, and the Brassfield Dolomite consists of dolomite (Peterson, 1981). All three Silurian-aged formations underlie the hillsides surrounding Sympson Lake (Crawford, 2010). The reservoir and dam are underlain by the Drakes Formation of Ordovician age. The Drakes Formation is subdivided into three members within Central Kentucky: the Saluda Dolomite, Bardstown, and Rowland members. The Saluda Dolomite

Member consists of dolomite and is partly calcitic and muddy. The Bardstown Member consists of fossiliferous limestone with calcitic shale and underlies most of the foundation and abutments. The Rowland Member consists of dolomitic mudstone to muddy limestone and underlies the embankment (Dames and Moore, 1976; Weir et al., 1984).

4.1.2 Karst Hazards

Statewide hazard mapping published by the Kentucky Geological Survey (KGS) indicates the bedrock underlying the site and adjacent areas has a moderate potential for the development of karst features with the progression of karst terrain variable and dependent upon site-specific conditions (Paylor & Currens, 2001). Site specific mapping suggests the Drakes Formation underlies the US 62 – Sympson Lake Dam embankment and is considered “low” potential for karst development. Adjacent Silurian bedrock is noted as exhibiting a “medium” potential for karst. Additionally, there is a documented history of karst features around the site, particularly at the dam’s left abutment, which may have led to the development of the surface depression along US-62 in 2021.

4.1.3 Past Explorations

Multiple geotechnical investigations have been performed at Sympson Lake since its construction. The investigations have included the following:

- In 1976, a field exploration including eight borings of the embankment and foundation bedrock was performed to support a seepage and stability evaluation of Sympson Lake Dam. According to the Phase I draft report *Evaluation and Rehabilitation Studies* dated November 1976 and based on this data, the dam is a zoned embankment with a central core comprised of stiff to very stiff silty clays and fine sandy clayey silts of low to medium plasticity. The report further stated the clay core is surrounded by a rockfill shell consisting of sandy clayey gravel with cobbles and boulders with sizes upwards of two feet in diameter. The shell material was obtained from road cuts at each end of the dam. The presence of filter zones or drainage layers was not documented in the study or other historical drawings. Based on historical drawings included in the report, the bedrock beneath the clay core was to be excavated five feet prior to backfilling. However, no construction photos or other documentation were available confirming these details. The exploration found bedrock to be jointed and fractured. Particularly, loss of drilling fluid was noted during coring operations within the limestone bedrock.
- In 1979, a field exploration, including five borings of the embankment, was performed to support the foundation design of the bridge abutments at the spillway. Borings logs found similar results as the 1976 geotechnical exploration. Rock coring was not performed for this investigation.

- As part of KYTC's 2021 sinkhole investigation, a ground penetrating radar (GPR) investigation was performed resulting in two areas noted as possible saturated soils or voids. One of the potentially saturated areas identified corresponded to the location of the sinkhole and the other was located approximately 82 feet east of the spillway bridge. A month after the GPR investigation, two borings were conducted in the area of the potentially saturated soils or voids. In the patched depression site, extremely wet soils were noted at a depth of 31.3 feet to 44.2 feet below surface. The second boring that was performed 82 feet east of the spillway bridge did not encounter the potentially saturated soils or voids.

5 Exploration Team

KYTC subcontracted Stantec Consulting Services, Inc. (Stantec), through a statewide on-call drilling contract, for the US 62 – Sympson Lake Dam exploration. Stantec performed the drilling and logged the borings while HDR engineers were on-site to verify grout quantities during backfilling and install vibrating wire piezometers within the required borings. Recovered soil and rock samples were transported to HDR's soil laboratory located in Paducah, Kentucky for testing. Adam Hacker, PE, from HDR oversaw the field exploration and laboratory testing program.

6 Geotechnical Exploration

The geotechnical exploration successfully collected representative samples of the encountered soil and bedrock to characterize material properties. A copy of the typed driller's and geologist's logs are provided in Appendix B along with photographs of the recovered rock cores. Additionally, three soil-bedrock profiles were developed to illustrate the depth to bedrock, standard penetration test (SPT) N-values, and groundwater table measurements. These profiles include one along the centerline of US 62, one embankment section west of the spillway, and one embankment section east of the spillway. The soil-bedrock profiles are provided in Appendix C.

6.1 Drilling

Vertical drilling through the embankment dam and foundation soils was accomplished by using Hollow Stem Augering (HSA) techniques conducted in general accordance with the guidelines presented in ER 1110-1-1807 (USACE, 2014) and EM 1110-1-1804 (USACE, 2001). Upon refusal with the HSA, the borings were advanced into the underlying bedrock formation using a NQ wireline rock coring system. Rock coring was conducted within HQ sized steel casing installed within the 4-¼ inch HSA and seated into the underlying bedrock to develop a hydraulic seal prior to NQ rock coring.

6.1.1 Crest Borings

Ten borings were advanced from the embankment crest with six (1001 through 1006) positioned along the upstream side (westbound lane shoulder) and four (1007, 1008, 1010, and 1012) on the downstream side (eastbound lane shoulder). The borings were advanced utilizing 4-¼ inch HSA techniques (ASTM D6151) to auger refusal. NQ-size rock coring was conducted for a minimum length of five feet in the downstream borings and 20 feet in the upstream borings. Coring continued beyond these lengths, as necessary, to achieve a recovery of more than 85 percent for the final core run.

6.1.2 Toe Borings

Two borings (1009 and 1011) were advanced near the dam toe using 4¼-inch HSA techniques (ASTM D6151). The borings were advanced to auger refusal after which five feet of NQ-size rock core was conducted.

6.1.3 Piezometers

Six borings (1007 to 1012) had vibrating wire piezometer nests (ranging from one to three piezometers) installed to monitor porewater pressures within the embankment and bedrock. Table 6-1 summarizes the locations of the nested piezometers. Piezometer installation logs are included in Appendix D. Piezometer readings were taken during installation and again on November 13, 2024, upon completion of all instrumentation installations. The readings are included in Appendix D.

Vibrating wire piezometers were installed with the porous disk pointed up on a sacrificial 1-inch PVC tremie pipe, sequentially from the bottom up through the center of the HSAs, ensuring full-depth installation before grouting and tool removal. A sacrificial tape was attached along the tremie pipe to ensure accurate depth measurements and proper documentation in the installation logs. A photograph log documenting the piezometer installation is included as Appendix E.

Table 6-1. Summary of Piezometer Installation (As-Drilled)

Boring ID	Surface Elevation (NAVD88)	Top of Bedrock Depth (feet)	Piezometer ID[1]	Piezometer Tip Depth (feet)	Piezometer Tip Elevation (NAVD88)
1007	530.29	72.9	1007-PZ-U	39.8	490.5
			1007-PZ-L	70.8	459.5
1008	529.38	68.0	1008-PZ-U	26.0	503.4
			1008-PZ-M	50.0	479.4
			1008-PZ-L	65.0	464.4
1009	468.95	14.3	1009-PZ	18.3	450.7
1010	529.69	50.0	1010-PZ-U	30.0	499.5
			1010-PZ-M	48.2	481.5
			1010-PZ-L	54.2	475.5

Boring ID	Surface Elevation (NAVD88)	Top of Bedrock Depth (feet)	Piezometer ID[1]	Piezometer Tip Depth (feet)	Piezometer Tip Elevation (NAVD88)
1011	469.07	14.5	1011-PZ	14.0	455.1
1012	530.08	14.9	1012-PZ-U	12.9	517.2
			1012-PZ-L	18.9	511.2

[1] U = Upper; L = Lower; M = Middle. The U, L, and M designations refer to the sequence of piezometers within each boring, with "U" indicating the shallowest depth, "M" representing the middle depth, and "L" denoting the deepest.

Personnel from KYTC's Geotechnical Services Branch installed two, eight-channel data loggers the weeks of March 10 and 17, 2025, to record readings from the piezometers. The data logger positioned west, or right, of the spillway will monitor piezometers in borings 1007, 1008, and 1009, while the logger installed east, or left, of the spillway will monitor those in borings 1010, 1011, and 1012.

KYTC's Geotechnical Services Branch collected piezometer readings during a high-water event from April 7 to April 28, 2025, and transmitted the data to HDR. The readings, collected at three-hour intervals, are included in Appendix D. The measured pressure was converted to a pressure head (in feet), then to both elevation and depth below ground surface. Appendix D also includes time-series plots of the piezometric elevation for each piezometer.

Additionally, a thirteenth vibrating wire piezometer with a single channel logger (designated as "1013") was attached to the side wall of the existing raw water intake tower to provide timestamped lake level readings to correlate with future readings from the nested piezometers. This piezometer was also installed by KYTC's Geotechnical Services Branch on July 16, 2025. A cellular data logger was installed at the lake level piezometer to provide readings remotely at a 10-minute reading frequency.

6.2 Deviations from the Boring Plan

In general, drilling operations were followed as outlined in the approved boring plan except for the two borings described below.

6.2.1 Additional Advancement of Boring 1005

Boring 1005 located on the embankment crest, upstream side, was scheduled to be advanced to the top of bedrock and include 20 feet of rock coring. As noted in the boring plan, if core recovery for the final 5-foot barrel run was less than 85 percent, the boring were extended in 5-foot increments until an 85 percent recovery was achieved. The rock encountered from a depth of 47.3 feet (or El. 482.5) to 62.3 feet (or El. 467.5) was described as sandy shale and had recoveries ranging from 56 to 65 percent. As such, the core was extended in accordance with the boring plan, and the final core run from a depth of 62.3 to 67.3 feet was described as limestone with a 100

percent recovery. Coring was terminated at a depth of 67.3 feet for a total core length of 31.4 feet.

6.2.2 Additional Advancement of Boring 1008

Boring 1008 on the embankment crest, downstream side, was scheduled to be advanced to the top of bedrock and include five feet of rock coring. As noted above, borings were extended in 5-foot increments until an 85 percent recovery rate was achieved. The rock encountered from a depth of 68.0 feet (or El. 456.9) to 74.0 feet (or El. 450.9) was described as limestone with shale and had a recovery of 55 percent. As such, the core was extended in accordance with the boring plan, and the final core run from a depth of 74.0 to 79.0 feet was described as limestone with a 100 percent recovery. Coring was terminated at a depth of 79.0 feet for a total core length of 11.0 feet.

6.3 Sampling Methods

The Stantec drilling team performed undisturbed soil sampling in the 12 borings previously discussed in Section 3.2, following the KYTC Geotechnical Guidance Manual, except for approved deviations noted in the boring plan. Continuous sampling was conducted throughout all soil layers, utilizing a combination of Standard Penetration Tests (SPT) and Thin-Walled Shelby Tube (ST) samples, depending on the soil type encountered.

6.3.1 SPT Sampling

Undisturbed SPT sampling (ASTM D1586) was conducted continuously in the borings, except where ST samples were taken, as shown in the typed boring logs in Appendix B. A 2-inch outside diameter standard split spoon sampler per ASTM D1586 was utilized to collect enough sample material to support the laboratory testing program. Samples were logged in the field, placed into glass jars with an airtight lid and transported to HDR's laboratory in Paducah, Kentucky for further testing.

6.3.2 Shelby Tube Sampling

Undisturbed ST sampling (using a 3-inch diameter tube per ASTM D1587) was conducted within cohesive soils at varying intervals, typically every 5 to 10 feet, as detailed in the typed boring logs in Appendix B. However, at the toe borings, ST samples were collected continuously. After pushing to the bottom of the sample interval, the tube was left at depth prior to withdrawing to allow pore pressures to dissipate and improve recovery.

6.4 Completion and Backfilling

Upon completion of drilling and sampling activities, borings were backfilled with a cement-bentonite grout as described in the approved boring plan. Table 6-2

summarizes the materials used to backfill and complete each boring. The subsequent sections discuss the completion methods for borings with and without piezometers.

Table 6-2: Summary of Backfilling Grout Quantities

Boring ID	Piezometer(s) [Y/N]	Cement-Bentonite Grout Backfill Quantities				Percentage of Theoretical Grout Quantity Placed (%)	Grout Loss [Y/N]
		94 lb. Bags of Portland Cement	50 lb. Bags of Granular Bentonite	5 Gal. Buckets of Bentonite Pellets	50 lb. Bags of Well Filter Sand		
1001	N	10	5	-	-	143	N
1002	N	12	6	4	-	169	Y
1003	N	8	4	1	-	113	N
1004	N	6	3	1	-	113	N
1005	N	4	2	1	-	116	N
1006	N	4	2	1	-	223	Y
1007	Y	6	3	-	-	86	N
1008	Y	10	5	2	-	155	Y
1009	Y	2	1	-	-	139	N
1010	Y	4	2	1	3	94	N
1011	Y	2	1	1	-	143	N
1012	Y	2	1	1	1	113	N

6.4.1 Boring Backfilling without Instruments

Borings (1001 through 1006) were backfilled with a cement-bentonite grout with an approximate Water : Cement : Bentonite (W:C:B) ratio (by weight) of 2.5 : 1.0 : 0.3. A tremie pipe was lowered to the bottom of boreholes and grout was injected as the drilling tools were removed to displace water to appropriately seal the boring. This grout mix maintained a minimum factor of safety of 1.3 against hydrofracturing during the boring backfilling process, allowing for continuous placement without the need for staged operations.

Before grouting, bentonite pellets were typically placed up to the top of the bedrock and allowed the pellets to hydrate and swell. In most borings, it was observed that without a bentonite plug in the bedrock column prior to grouting, the grout would be lost into the foundation. HDR's field personnel monitored Buffalo Creek near the former outlet for signs of muddy water or grout migration during the backfilling of Borings 1005 and 1006, but no visual signs of muddy water or grout were observed. Table 6-3 summarizes the grout records maintained by HDR for the borings without instrumentation.

Table 6-3: Summary of Grout Records for Borings without Piezometers

Boring ID	Location Description[1]	Depth to Top of Bedrock (feet)	Depth to Bottom of Boring (feet)	Theoretical Grout Quantity (gal)	Comment[2]
1001	Right of Spillway, Upstream	66.3	87.1	230	▪ Placed 350 gallons of grout ▪ Some grout loss experienced
1002	Right of Spillway, Upstream	71.8	93.7	246	▪ Placed 240 gallons of grout; grout was not observed at surface ▪ Two buckets of bentonite pellets added to establish a plug up to 66.0 feet BGS ▪ Placed additional 105 gallons of grout; grout lost in dam shell ▪ Additional two buckets of bentonite pellets were added up to 45.0 feet BGS ▪ Placed additional 105 gallons of grout for completion
1003	Right of Spillway, Upstream	72.3	94.3	246	▪ Placed 140 gallons of grout; grout was not observed at surface ▪ Two buckets of bentonite pellets added to establish a plug up to 70.0 feet BGS ▪ Placed additional 140 gallons of grout for completion
1004	Right of Spillway, Upstream	67.3	85.3	184	▪ One bucket of bentonite pellets added to establish a plug; boring held water, therefore, immediately grouted ▪ Placed 165 gallons of grout
1005	Left of Spillway, Upstream	35.9	67.3	120	▪ Two buckets of bentonite pellets added to establish a plug up to 38.3 feet BGS ▪ Placed 110 gallons of grout
1006	Left of Spillway, Upstream	16.4	35.7	62	▪ Placed 70 gallons of grout; grout loss measured down to top of bedrock ▪ One bucket of bentonite pellets added to establish a plug up to 23.2 feet BGS ▪ Placed 50 gallons of grout for completion

[1] Left or right is relative to an observer looking downstream from the dam's crest. Left = East; Right = West.
[2] All grout quantities are approximate. BGS = Below ground surface.

6.4.2 Boring Backfilling with Instruments

Upon reaching the completion depth, piezometer nests were installed through the top of the HSAs within Borings 1007 through 1012 as detailed in Table 6-1 and the piezometer installation logs in Appendix D. Each piezometer was installed at depths generally in accordance with Table 2 of the approved boring plan.

The depth below the ground surface of each piezometer was determined based on the as-drilled location and measurements from the sacrificial measuring tape. Piezometer nests were installed in various configurations: Borings 1009 and 1011 each contained one piezometer, 1007 and 1012 each contained two piezometers, and 1008 and 1010 each contained three piezometers. The piezometers were generally installed using the fully grouted method; however, the lower (L) and middle (M) piezometers in 1010 and 1012 were backfilled with a typical well filter sand due to excessive grout takes

experienced within the lower reaches of the borings. Additional information on the piezometer installation and backfill is included in the logs in Appendix D. The cement-bentonite grout was stopped two feet below the ground surface to allow for trenching and routing of the piezometer cables to the data loggers.

7 Laboratory Testing

Upon completion of drilling activities, HDR retrieved the soil and bedrock samples from Stantec's Lexington, Kentucky office and transported them to HDR's Paducah laboratory. The samples were preserved and transported in accordance with ASTM D4220. They were then tested at HDR's laboratory following the approved laboratory testing program, as outlined in the request letter dated February 11, 2025. All laboratory tests were conducted in accordance with the applicable AASHTO, KM and/or ASTM standard testing procedures. Table 7-1 below provides an overview of the laboratory tests completed for this project.

Table 7-1: Summary of Laboratory Testing Program

Test Type	Test Method	Quantity
Moisture Content	AASHTO T 265	351
Atterberg Limits	AASHTO T 89 / AASHTO T 90	118
Particle Size Analysis	KM 64-519	118
Specific Gravity	AASHTO T 100	118
Consolidation-Undrained (CU) Triaxial	ASTM D4767	13
Unconsolidated-Undrained (UU) Triaxial	AASHTO T-296	13
Unconfined Compressive (Soil)	AASHTO T-208	6
Falling Head Permeability	ASTM D5084	9
Unconfined Compressive (Rock)	ASTM D7012	14
One-Dimensional Consolidation Test	ASTM D2435	2
General Corrosivity Test Series As-Received and Saturated Electrical Resistivity pH Chemical Analysis for Anions and Cations	ASTM G187-23 ASTM G51-23 ASTM D6919-17, ASTM D4327-17, and AWWA 2320-B	3

The results of the laboratory tests are provided in Appendix F. Additionally, HDR prepared plots of test results versus elevation for moisture content, plasticity index (PI), percent fines (< #200 sieve), pocket penetrometer strength, compressive strength, and unit weight. An additional plot is provided for the field SPT N-values versus depth. The plots of laboratory test results versus elevations are included as Appendix G.

8 Preliminary Evaluations

HDR developed a preliminary 3D subsurface model to evaluate the spatial distribution of the anomalies identified during our geophysical survey and their proximity to critical structures, including the US62 bridge foundation and the former primary spillway comprising of a tower and a 4-foot by 4-foot reinforced concrete box culvert (RCBC) running northwest to southeast through the embankment. The model is based on available data at the time of this report, including the current and historical subsurface explorations, historical drawings, and correlation with the geophysical results. The following section provides a brief overview of the 3D model construction.

8.1 Preliminary 3D Subsurface Model

The preliminary three-dimensional subsurface model was developed using Leapfrog Geo (Version 2023.2), a geological modeling software developed by Seequent, a Bentley company. Leapfrog creates subsurface models from geotechnical boring data, geophysical surveys, and other geospatial sources using implicit modeling to generate surfaces and volumes that can be visualized in 3D or extracted as 2D cross sections.

Leapfrog was specifically used to develop a 3D model at the embankment, including surfaces representing the top of bedrock and the phreatic surface. The bedrock surface was defined using data from both current borings and historical borings conducted by others in 1976 and 1979, as referenced in Section 4.1.3, along with results from the seismic refraction survey. The phreatic surface was approximated using piezometric readings collected in April 2025. The locations of the anomalous zones beneath the spillway were approximated from the geophysical survey data. Existing ground surface elevations were derived from available Kentucky LiDAR data.

The Leapfrog model also includes the approximate locations of existing foundations for the US62 bridge over the spillway, including the limits of the required temporary excavation in 1979, and the former RCBC primary spillway penetrations. HDR generated 3D representations of these structures in Civil 3D using historical drawings provided by KYTC’s Geotechnical Services Branch and the City of Bardstown. Because the available drawings did not include coordinate references and no recent survey data is known to exist, the structure locations were correlated with current aerial imagery and should be considered approximate.

Two-dimensional cross sections extracted from the Leapfrog model are included in Appendix H. These cross sections are provided at key locations along the dam, including one along the centerline of the spillway that illustrates the position of the geophysical anomaly in relation to the bridge foundation, bedrock surface, and existing RCBC penetration. Along the U62 alignment, two cross-sections were developed at the offsets matching seismic refraction Lines 2 and 3 from HDR's geophysical survey. Two additional cross sections were developed on a southwest-to-northeast skew

relative to the US62 centerline, one of which intersects the approximate location of the depression/sinkhole near the spillway wingwall at the left abutment.

A plan view illustrating the locations of the extracted cross-sections is included in the lower right corner of each cross-section sheet, contained within Appendix H. HDR has provided KYTC's Geotechnical Services Branch with the Leapfrog model file, which can be viewed using Seequent's free Leapfrog Viewer software to explore the features and subsurface model in 3D.

9 Conclusion and Recommendations

9.1 Findings

This geotechnical investigation found evidence of poor bedrock quality within the upper five to ten feet of bedrock. More specifically, the findings include the following:

- Highly weathered bedrock with clay seams
- Open features which were reported as voids in the boring logs
- Grout loss during borehole backfilling
- Low core recovery and RQD values

Additionally, the geophysical survey conducted by HDR identified two potential anomalies near the concrete spillway, coinciding with data gaps beneath the spillway where sensors could not be placed. Measured P-wave velocities at the geophysical anomaly beneath the spillway ranged from approximately 5,500 to 6,500 ft/sec, which is consistent with values expected for water or water-filled voids. These findings suggest that no positive cutoff exists along the foundation interface beneath the backfill placed during the 1979 spillway and bridge foundation construction.

As previously discussed, a 3D subsurface model was used to visually represent the characterization of the subsurface conditions from the available data. Particularly, Cross Section E in Appendix H – which roughly intersects the existing sinkhole/depression — illustrates the convergence of four key features: a potentially steep bedrock surface, a geophysical anomaly, dipping phreatic surface suggesting higher gradients, and the limits of the temporary excavation from the 1979 construction drawings. These features are in the same location where signs of distress have been observed for nearly 40 years (sinkholes and seepage).

9.2 Recommendations

The 2022 SQRA identified a high risk of concentrated leak erosion along the embankment and foundation contact, with a high level of confidence. Findings from this exploration further validate the mechanisms responsible for the observed distress (e.g., sinkholes and seepage). The apparent poor condition of the embankment contact is supported by the presence of voids, weathered condition of the bedrock,

grout loss near the bedrock surface, and reduction of sample recovery which suggest the presence of more coarse soils or weathered bedrock. Based on the available information, it appears that the dam does not have defensive measures, such as modern granular filters, seepage control features or foundation treatment, to arrest erosion. As reported in the 2022 SQRA, not mitigating these underlying issues with the dam could lead to dam failure and uncontrolled release of the reservoir and loss of US-62, which would have significant impacts to the local community.

Therefore, it is recommended to take action to mitigate leak erosion risks by cutting off the seepage along the embankment-bedrock contact to arrest continuing erosion of the embankment. If additional investigation is pursued, we recommend traditional rotary drilling targeted at the anomalous zones. This could include inclined borings from the dam crest outside the spillway footprint, vertical borings arranged in a semi-circle around the anomaly, or vertical borings directly within the spillway area. These investigations should ideally occur prior to final design and bid letting; however, if not, they could be incorporated into the contractor's scope and completed prior to construction of any cutoff wall or seepage mitigation measures. If voids or discontinuities are encountered, the construction sequence could include supplemental grouting as part of the seepage mitigation strategy. It is our opinion that further geophysical methods would not effectively identify and detail the anomalies due to interference from the spillway structure.

Lastly, there are no signs of structural movement, subsidence, or distress affecting the spillway or bridge foundation. However, it is recommended that the spillway and bridge abutments continue to be routinely inspected or monitored by survey to detect any signs of distress that may warrant further investigation.

10 Limitations to Report

The data presented in this report is based on subsurface explorations by subcontractors and is intended only for this specific project. Services provided by HDR during this phase of subsurface investigation and data accumulation are consistent with the level of care of members practicing in this profession. No other warranties, expressed or implied, are intended or included in the services provided thus far.

This geotechnical investigation report offers no opinions and evaluations, other than what is stated in the boring logs, related to any subsequently following design steps of the embankment dam and ancillary structures. Site conditions may vary from observations made at the time of our subsurface explorations. In addition, soil and bedrock conditions can be highly variable across the project site.

Further, the assumed nature and physical properties of subsurface conditions between in-situ samples obtained may not become evident until execution of future construction and/or additional exploration activities. The preliminary 3D subsurface model is based

on a limited number of borings and geophysical data, and represents a conceptual interpretation of subsurface, bedrock, and pore water conditions. Variations between data points were interpolated using professional judgment and may not reflect actual conditions. The model is intended for preliminary visualization only and should not be relied upon for future design without further investigation.

Vibrating Wire Pressure Transducer Calibration Report

Model Number: 4500S-350 kPa

Date of Calibration: May 29, 2024

This calibration has been verified/validated as of 08/27/2024

Serial Number: 2420902

Temperature: 21.80 °C

Calibration Instruction: CI-Pressure Transducer (7 kPa~3.5 MPa)

Barometric Pressure: 991.8 mbar

Cable Length: 500 feet

Technician: R Judd

Applied Pressure (kPa)	Gauge Reading 1st Cycle	Gauge Reading 2nd Cycle	Average Gauge Reading	Calculated Pressure (Linear)	Error Linear (%FS)	Calculated Pressure (Polynomial)	Error Polynomial (%FS)
0.0	8839	8840	8840	-0.061	-0.02	0.091	0.03
70.0	8264	8264	8264	69.78	-0.06	69.82	-0.05
140.0	7685	7685	7685	140.0	0.01	140.0	0.01
210.0	7108	7108	7108	210.1	0.02	210.1	0.02
280.0	6531	6532	6532	280.0	0.01	280.1	0.02
350.0	5956	5957	5957	349.8	-0.06	350.0	-0.02

(kPa) Linear Gauge Factor (G): -0.1214 **(kPa/ digit)**

Polynomial Gauge factors: **A:** 8.493E-08 **B:** -0.1226 **C:**

Thermal Factor (K): -0.08094 **(kPa/ °C)**

Calculate C by setting P=0 and R_1 = initial field zero reading into the polynomial equation

(psi) Linear Gauge Factor (G): -0.01760 **(psi/ digit)**

Polynomial Gauge Factors: **A:** 1.232E-08 **B:** -0.01778 **C:**

Thermal Factor (K): -0.01174 **(psi/ °C)**

Calculate C by setting P=0 and R_1 = initial field zero reading into the polynomial equation

Calculated Pressures:

Linear, $P = G(R_1 - R_0) + K(T_1 - T_0) - (S_1 - S_0)$*

Polynomial, $P = AR_1^2 + BR_1 + C + K(T_1 - T_0) - (S_1 - S_0)$*

*Barometric pressures expressed in kPa or psi. Barometric compensation is not required with vented transducers.

Factory Zero Reading: 8840 **Temperature:** 21.1 °C **Barometer:** 996.8 mbar

The above instrument was found to be in tolerance in all operating ranges.
The above named instrument has been calibrated by comparison with standards traceable to the NIST, in compliance with ANSI Z540-1.

This report shall not be reproduced except in full without written permission of Geokon.

T_0 = 25.7°C S_0 = 29.94 in R_0 = 2974.7 Hz / 8849.1 Digits

(kPa) Linear Gauge Factor (G): -0.05005 (kPa/ digit)

Polynomial Gauge factors: A: -1.023E-07 B: -0.04830 C:

Thermal Factor (K): -0.0001413 (kPa/ °C)

Calculate C by setting P=0 and R_1 = initial field zero reading into the polynomial equation

(psi) Linear Gauge Factor (G): -0.007259 (psi/ digit)

Polynomial Gauge Factors: A: -1.484E-08 B: -0.007005 C:

Thermal Factor (K): -0.00002050 (psi/ °C)

Calculate C by setting P=0 and R_1 = initial field zero reading into the polynomial equation

Calculated Pressures:

Linear, $P = G(R_1 - R_0) + K(T_1 - T_0) - (S_1 - S_0)$*

Polynomial, $P = AR_1^2 + BR_1 + C + K(T_1 - T_0) - (S_1 - S_0)$*

*Barometric pressures expressed in kPa or psi. Barometric compensation is not required with vented transducers.

Factory Zero Reading: 10250 Temperature: 21.2 °C Barometer: 997.4 mbar

The above instrument was found to be in tolerance in all operating ranges
The above named instrument has been calibrated by comparison with standards traceable to the NIST, in compliance with ANSI Z540-1

D3. April 2025 Readings

East End Piezometers – Borings 1010, 1011, and 1012

Project: US-62 - Sympson Lake Dam
Subject: Geotechnical Investigation
Task: East End Piezometer Reading Plots
Job #: 10354982

Computed by: Robbins, Bryan Date: 3/11/2026
Checked by: Moulton, Drake Date: 3/11/2026
Workbook: East end Piezometers (6)_2025-03-01_2025-04-28.xlsx

East End Piezometers - Borings 1010, 1011, and 1012

US62 CL PROFILE
SCALE: 1" = 30'

KEY:

1008-PZ-X — Range of measured pressures from 04/07 - 04/28/25 Values on 04/28/25 are assumed to represent near normal operating conditions.

* For the Leapfrog model, the phreatic surface elevation at each boring is generally based on the average of the minimum pressure readings from the nested piezometers.

Piezometer Photograph Log

March 12, 2026

Photograph Log

Photo 1	Attaching Piezometer Cable and Sacrificial Measuring Tape to PVC Tremie Pipe at Boring 1007.

Photo 2	Sacrificial Measuring Tape Attached to the first 10-foot Piece of PVC Tremie Pipe at Boring 1007.

Photo 3	Piezometer 1007-PZ-L Secured to the first 10-foot Piece of PVC Tremie Pipe.

Photo 4	Attaching Cables to PVC Tremie Pipe and installing Piezometer 1007-PZ-U downhole in the Hollow Stem Augers (HSA).

Photo 5	Bundling Piezometer Cables at Boring 1007 in Preparation for HSA Removal.

Photo 6	Feeding Piezometer Cables Through HSA During Removal at Boring 1007.

Photo 7	Piezometers Installed at the Bottom of Boring 1007 Before Grouting and HSA Removal.

Photo 8	Piezometers at Boring 1007 at Completion.

Photo 9	Attaching Piezometers, Cables, and Sacrificial Measuring Tape to PVC Tremie Pipe at Boring 1010.

Photo 10	Piezometer 1010-PZ-L Secured to the first 10-foot Piece of PVC Tremie Pipe.

Photo 11	Tremieing Filter Sand Around Piezometer 1010-PZ-L.

Photo 12	Attaching Piezometers, Cables, and Sacrificial Measuring Tape to PVC Tremie Pipe at Boring 1012.

Photo 13	Piezometers Installed at the Bottom of Boring 1012 Before Grouting and HSA Removal.

Photo 14	Piezometers at Boring 1012 at Completion.

ROCK DESCRIPTION : Limestone, Dark Gray, Fossiliferous

Machine Used : ELE CT-7250

Diameter :	1.98 in	Area :	3.08 in²
Height :	4.24 in	Volume :	0.0076 ft³

RESULTS :

Air Dry Moisture:	0.5	%
Air-Dry Density :	164.0	lbs/ft.³
Maximum Stress :	5,864	psi
Elapsed Time :	6:06	min.
Rate of Loading :	60	lb/sec

TRANSMITTAL LETTER

DATE: March 12, 2025

ATTENTION: **Donald Schmidt**

TO: HDR, Paducah
4645 Village Square Drive, Suite F
Paducah, KY 42001

SUBJECT: Laboratory Test Data
Sympson Lake Dam
Your #10354982, HDR Lab #25-0139LAB

COMMENTS: Enclosed are the results for the subject project.

Teddie Algorri
Laboratory Manager

Table 1 - Laboratory Tests on Soil Samples

HDR, Paducah
Sympson Lake Dam
Your #10354982, HDR Lab #25-0139LAB
12-Mar-25

Sample ID			B-1001 @ 30.0-36.5	B-1005 @ 16.5-23.0	B-1003 @ 11.5-23.0
Resistivity		**Units**			
as-received		ohm-cm	>4,400,000	>4,400,000	>4,400,000
saturated		ohm-cm	3,560	2,040	1,760
pH			7.0	7.1	7.0
Electrical Conductivity		mS/cm	0.07	0.23	0.25
Chemical Analyses					
Cations					
calcium	Ca^{2+}	mg/kg	32	132	162
magnesium	Mg^{2+}	mg/kg	10	36	23
sodium	Na^{1+}	mg/kg	12	15	24
potassium	K^{1+}	mg/kg	6.0	18	11
ammonium	NH_4^{1+}	mg/kg	ND	1.0	1.0
Anions					
carbonate	CO_3^{2-}	mg/kg	ND	ND	ND
bicarbonate	HCO_3^{1-}	mg/kg	149	445	275
fluoride	F^{1-}	mg/kg	3.0	13	9.0
chloride	Cl^{1-}	mg/kg	4.0	5.0	22
sulfate	SO_4^{2-}	mg/kg	31	42	172
nitrate	NO_3^{1-}	mg/kg	3.0	1.0	1.0
phosphate	PO_4^{3-}	mg/kg	ND	ND	ND
Other Tests					
% moisture	H_2O	%	na	na	na
total acidity	H^{1+}	mmol/kg	na	na	na
sulfide	S^{2-}	qual	na	na	na
Redox		mV	na	na	na

Resistivity per ASTM G187, pH per ASTM G51, Cations per ASTM D6919, Anions per ASTM D4327, and Alkalinity per APHA 2320-B.

Electrical conductivity in millisiemens/cm and chemical analyses were made on a 1:5 soil-to-water extract.

mg/kg = milligrams per kilogram (parts per million) of dry soil.

Redox = oxidation-reduction potential in millivolts

ND = not detected

na = not analyzed

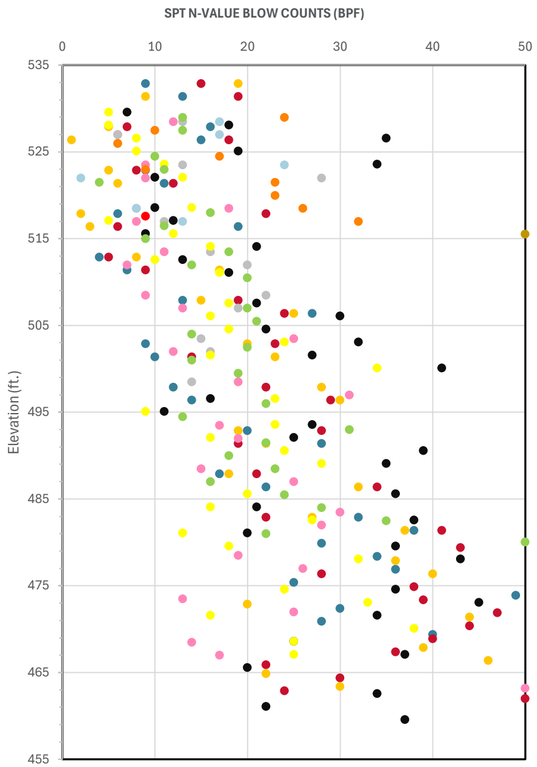

Appendix G

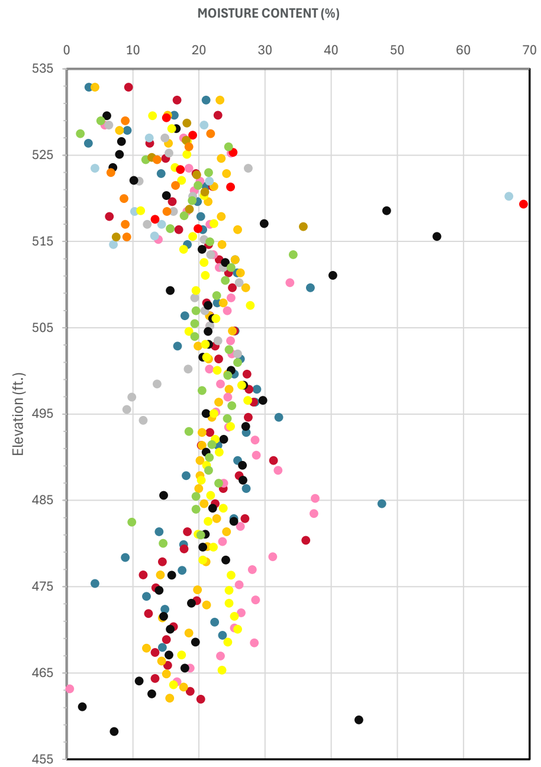

Investigation and Laboratory Results Plots

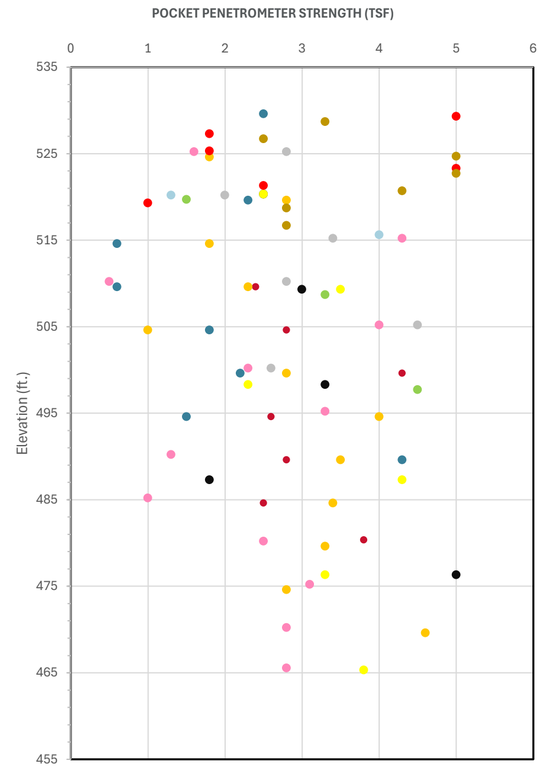

March 12, 2026

Project: US-62 - Sympson Lake Dam
Subject: Geotechnical Investigation
Task: Results v. Depth Plots
Job #: 10354982

Computed by: Robbins, Bryan Date: 3/28/2025
Checked by: Moulton, Drake Date: 3/28/2025
Workbook: Soil Data Sheet.xlsx

Appendix H

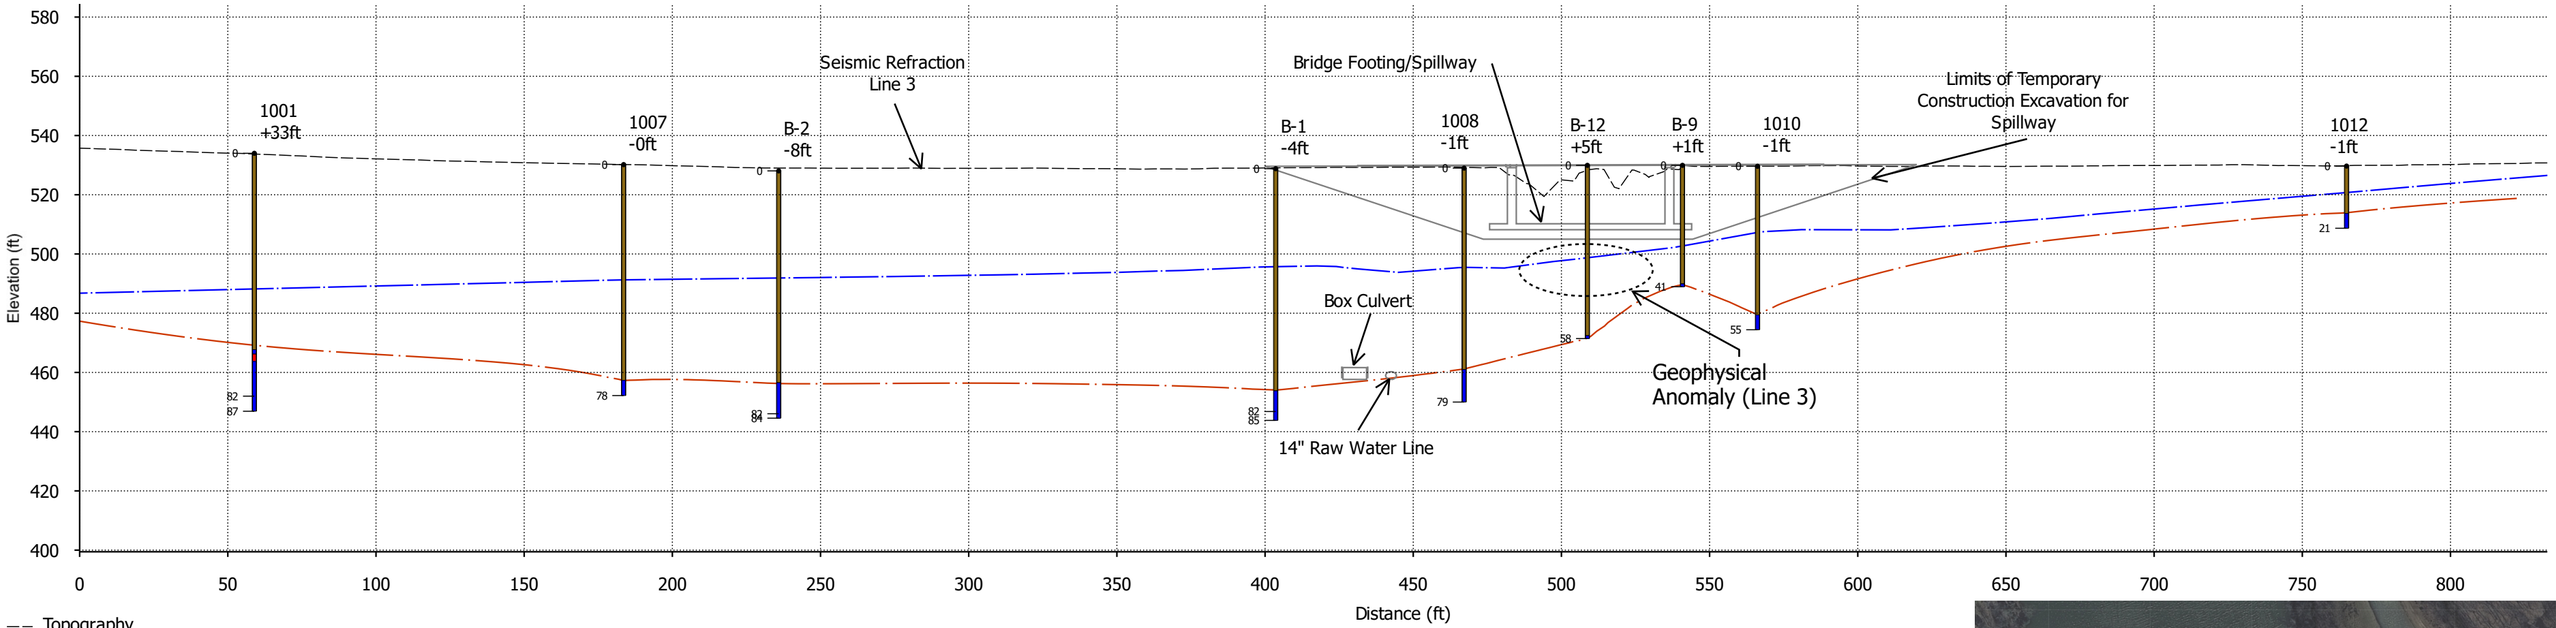

Leapfrog Cross Sections

Notes:
(1) Topography developed from KY LiDAR data.
(2) Location and dimensions of existing structures were approximated using historical documents provided to HDR, including construction and/or as-built drawings.
(3) Phreatic surface based on piezometer levels collected in April 2025.

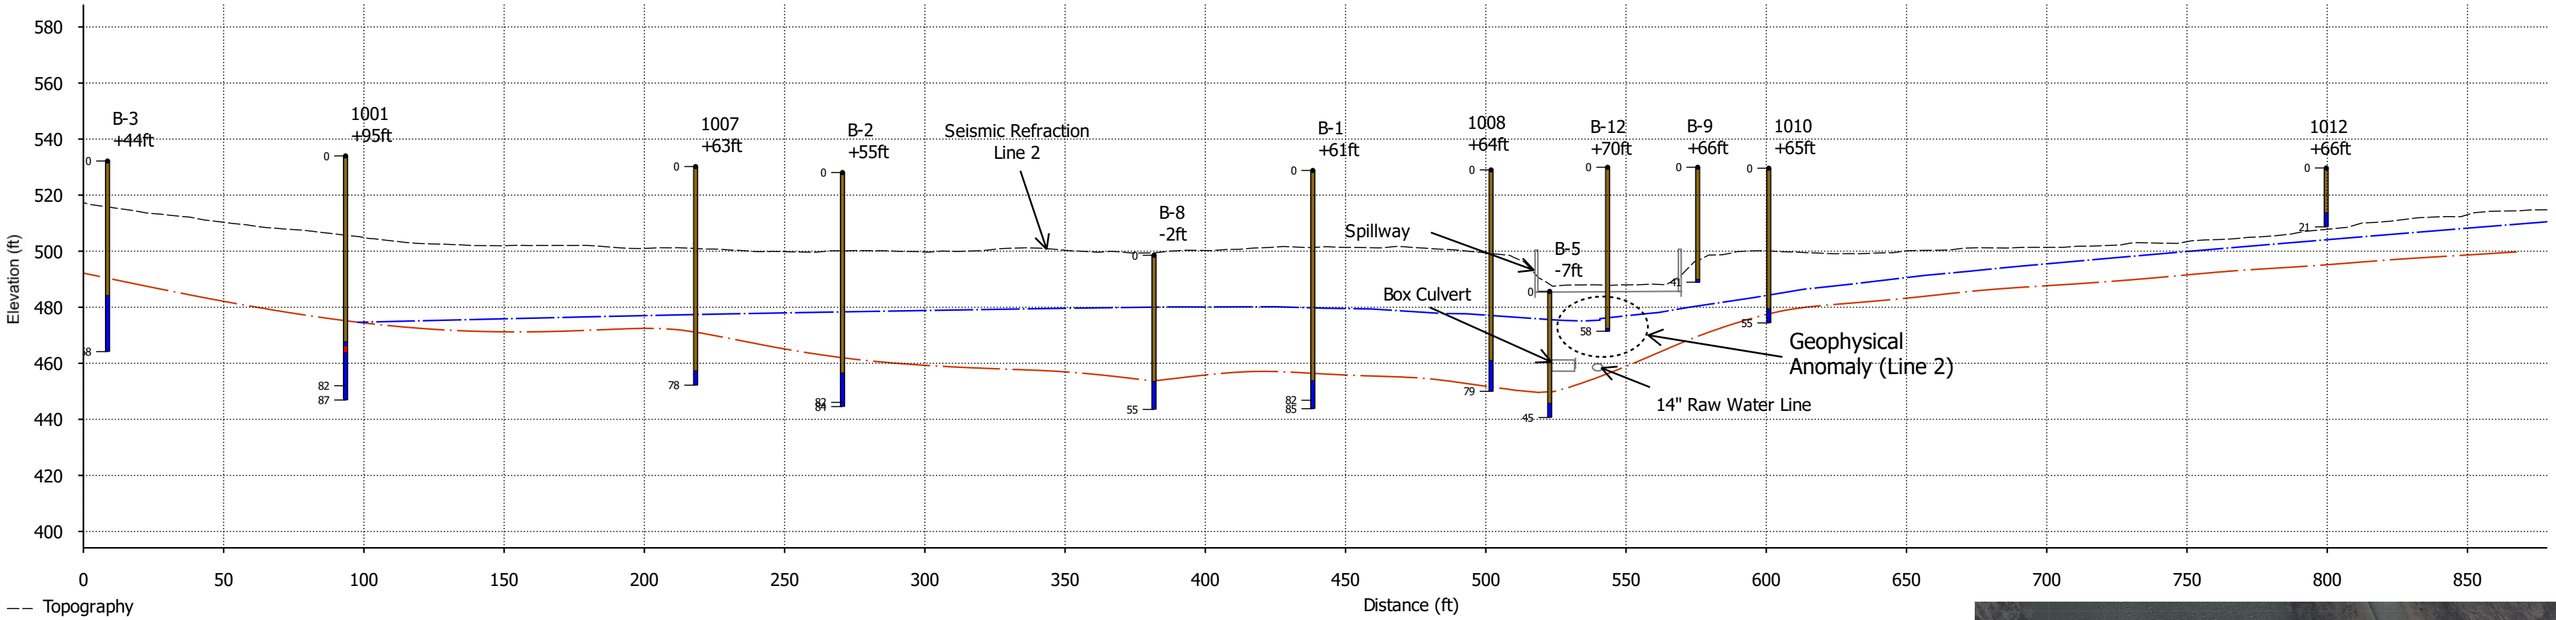

Leapfrog Subsurface Model
Sympson Lake Dam - Cross Section "A"
Bardstown, Nelson Co. KY

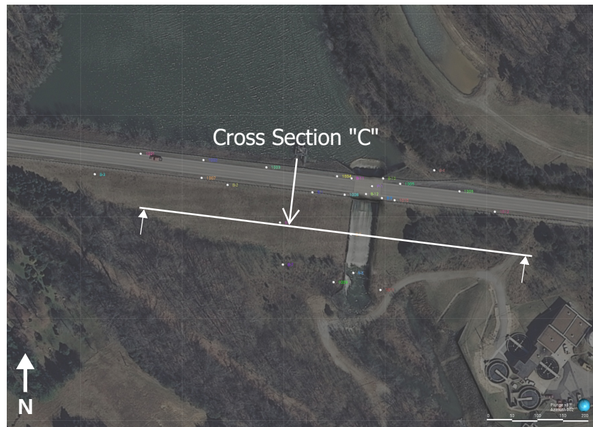

Notes:
(1) Topography developed from KY LiDAR data.
(2) Location and dimensions of existing structures were approximated using historical documents provided to HDR, including construction and/or as-built drawings.
(3) Phreatic surface based on piezometer levels collected in April 2025.
(4) Cross Section "B" corresponds to the HDR's Seismic Refraction Line 3.

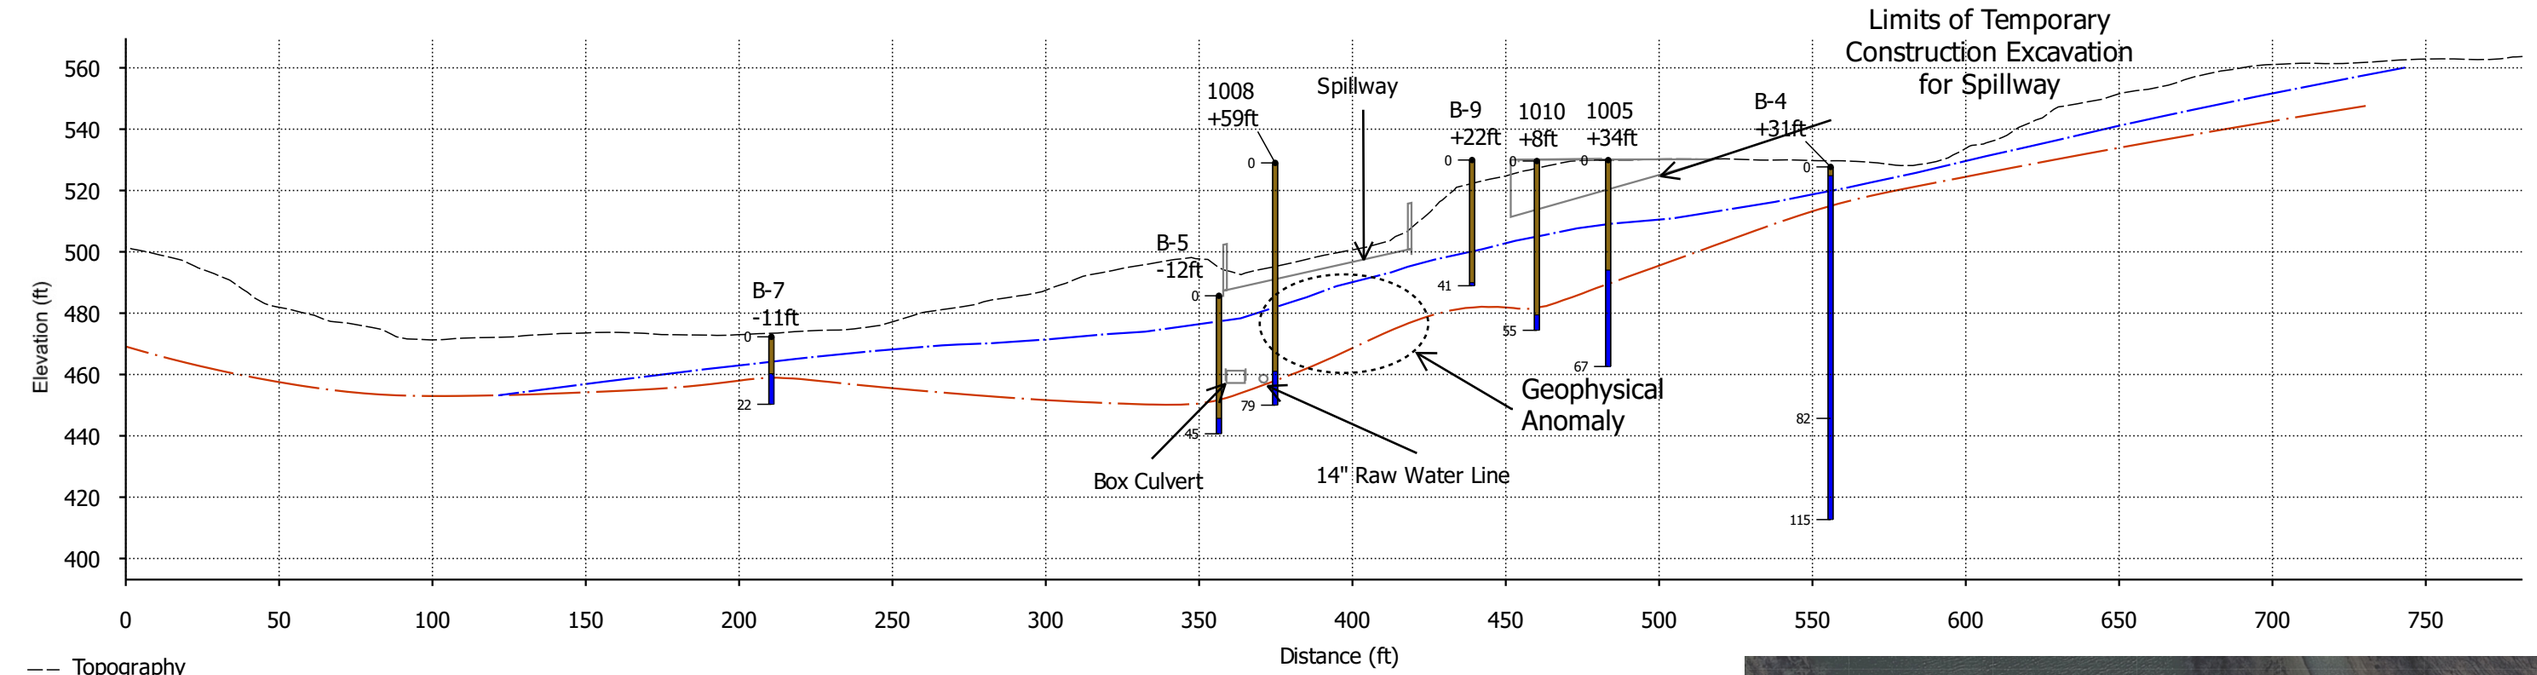

Leapfrog Subsurface Model
Sympson Lake Dam - Cross Section "B"
Bardstown, Nelson Co. KY

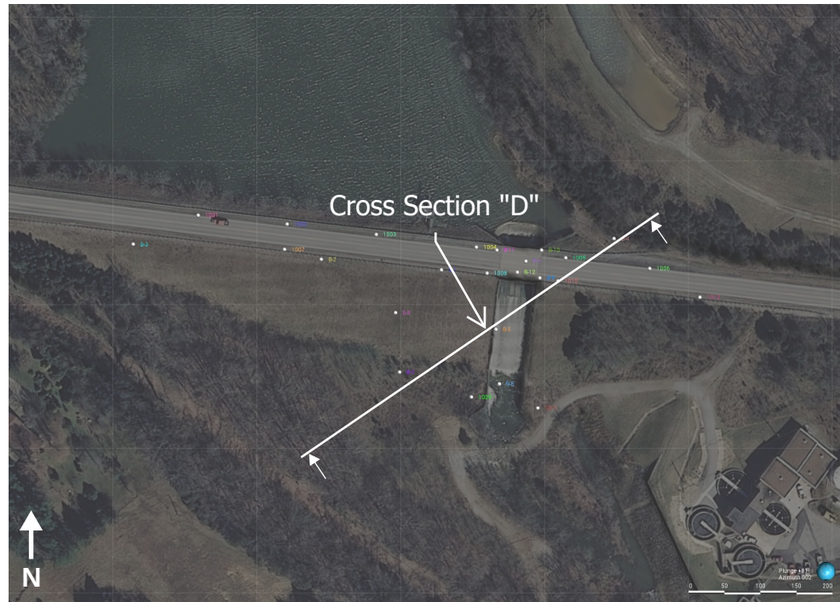

Notes:
(1) Topography developed from KY LiDAR data.
(2) Location and dimensions of existing structures were approximated using historical documents provided to HDR, including construction and/or as-built drawings.
(3) Phreatic surface based on piezometer levels collected in April 2025.
(4) Cross Section "C" corresponds to the HDR's Seismic Refraction Line 2.

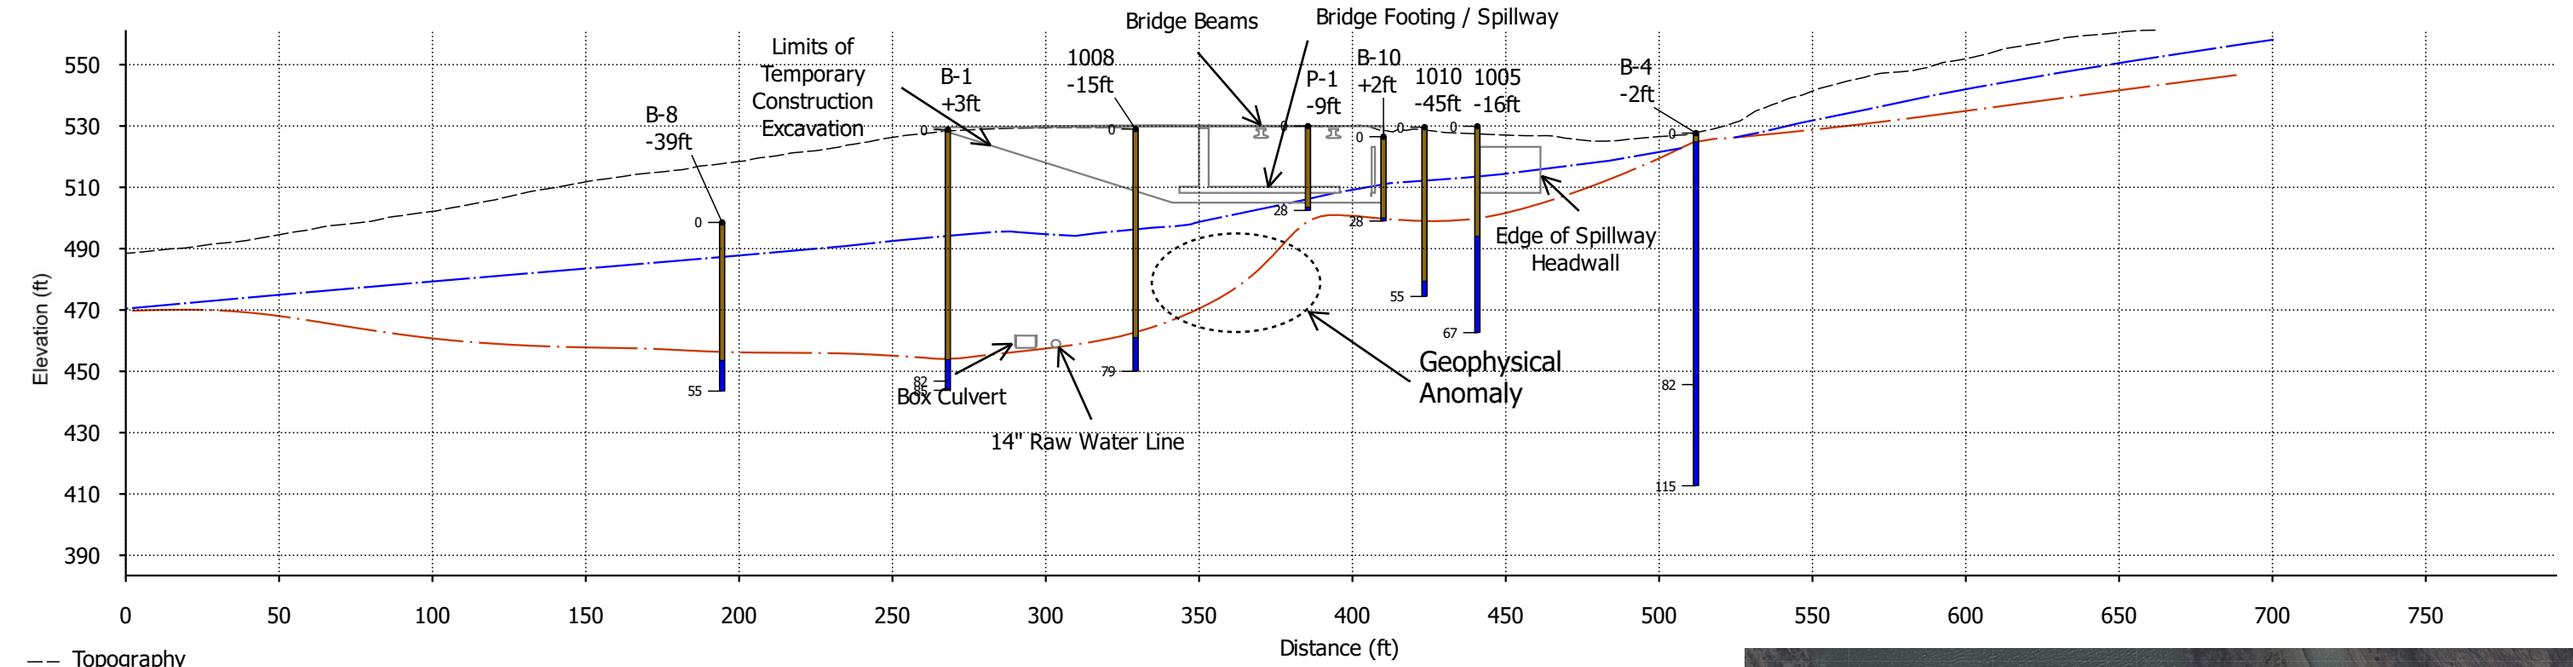

Leapfrog Subsurface Model
Sympson Lake Dam - Cross Section "C"
Bardstown, Nelson Co. KY

Notes:
(1) Topography developed from KY LiDAR data.
(2) Location and dimensions of existing structures were approximated using historical documents provided to HDR, including construction and/or as-built drawings.
(3) Phreatic surface based on piezometer levels collected in April 2025.

Leapfrog Subsurface Model
Sympson Lake Dam - Cross Section "D"
Bardstown, Nelson Co. KY

Notes:
(1) Topography developed from KY LiDAR data.
(2) Location and dimensions of existing structures were approximated using historical documents provided to HDR, including construction and/or as-built drawings.
(3) Phreatic surface based on piezometer levels collected in April 2025.

Leapfrog Subsurface Model
Sympson Lake Dam - Cross Section "E"
Bardstown, Nelson Co. KY
