

Andy Beshear  
GOVERNOR

TRANSPORTATION CABINET  
200 Mero Street  
Frankfort, Kentucky 40601

Jim Gray  
SECRETARY

August 14, 2025

CALL NO. 202  
CONTRACT ID NO. 251022  
ADDENDUM # 3

Subject: Rockcastle County, 102GR25D022  
Letting August 21, 2025

- (1) Added - Special Notes - Pages 35A-35C of 390
- (2) Added - Sewer Specs - Pages 201A-201F of 390
- (3) Revised - Special Notes - Pages 240-249 of 390
- (4) Revised - Material Summary - Pages 321-329A of 390
- (5) Revised - Proposal Bid Items - Pages 383-390A of 390
- (6) Revised/Added - Plan Sheets R2F, R82A, UQ1

Proposal revisions are available at <http://transportation.ky.gov/Construction-Procurement/>.

If you have any questions, please contact us at 502-564-3500.

Sincerely,

A handwritten signature in black ink that reads "Rachel Mills".

Rachel Mills, P.E.  
Director  
Division of Construction Procurement

### Special Note for Staking

---

Perform Contractor Staking according to Section 201; except, in addition to the requirements of Section 201, perform the following:

Once all pavement operations have been completed and there are no further project operations interfering with the travel lanes, notify in writing the Project Engineer and District Traffic Engineer to schedule the collection of CARS curve data, process and analyze the data collected and generate an updated proposed sign plan for the horizontal curves in or impacted by the project. Provide the District Traffic Engineer up to 4 weeks to provide the Project Engineer an updated proposed sign plan that incorporates changes resulting from the CARS data analysis. The Project Engineer will forward the revisions to the appropriate contractor(s). Then use stakes, paint marks on the pavement, mag nails, and/or any other means approved by the District Traffic Engineer, the Contractor shall mark and/or stake the proposed sign locations in the field.

NOTE: The proposed signs are listed in the proposal by approximate location and are NOT to be taken as the exact location for the signs. During staking operations, the Contractor shall review the signing layout and existing field conditions and look for potential conflicts, including but not limited to utilities, driveways, visual obstructions, etc. When conflicts are found, adjust the staked location of signs to mitigate conflicts. Because the sign locations in the proposal are approximate and the location of some signs may need to be adjusted due to conflicts, during staking operations the Contractor shall refer to and utilize the information in the Manual on Uniform Traffic Control Devices (MUTCD), current edition. The MUTCD cover items such as: appropriate sign location, advance placement distances, and spacing requirements for signing. The intent is for the proposed signs to be consistent with, and meet the requirements of, the MUTCD. Once the proposed sign locations have been staked and/or marked, notify and coordinate with the District Traffic Engineer, and perform a review of the staked and/or marked locations. Provide the District Traffic Engineer with 4 weeks of notice when a route will be ready for a review of the staked locations. This review will also be used to determine if there are any existing signs that require removal and/or relocation. Adjust the staked and/or marked locations, as directed by the District Traffic Engineer and obtain approval of the final staked and/or marked locations. Any pavement marking review requested for passing zones should be completed prior to final approval of staked and/or marked locations. Provide the District Traffic Engineer with an additional 4 weeks of notice when a route will be ready for a review of the staked locations. If there are multiple routes to be reviewed, the Contractor is encouraged to notify the District Traffic Engineer when each route is ready for a review of the staked locations.

NOTE: The District Traffic Engineer may determine that the proposed signing, including sign types and messages, needs to be adjusted and/or modified from what is shown in the proposal. Therefore, the Contractor shall not order any sign material for a route until the route has been staked and final sign location approval has been given by the District Traffic Engineer.

### Special Note for Signage

---

All sign sheeting shall be from the Cabinet's List of Approved Materials.

All permanent signs and sign components shall be fabricated using Type XI sheeting.

The following signs and sign components shall be fabricated using Type XI fluorescent yellow sheeting:

- Horizontal Alignment Signs and Plaques, including signs shown in Figure 2C-1 of the MUTCD
- All Advisory Speed (W13-1P) plaques

The following signs shall be fabricated using Type XI fluorescent yellow-green sheeting:

- School and school bus warning signs, including the fluorescent yellow-green signs shown in Figures 7B-1 and 7B-6 of the MUTCD and other school-related warning signs that are not included in the MUTCD.
- Bicycle Warning (W11-1) signs and SHARE THE ROAD (W16-1P) plaques or diagonal downward pointing arrow (W16-7P) plaques that supplement Bicycle Warning signs.
- Pedestrian Warning signs and diagonal downward pointing arrow plaques that supplement Pedestrian Warning signs.
- In-Street Pedestrian Crossing (R1-6) signs and Overhead pedestrian Crossing (R1-9) signs
- Supplemental plaques to any of the previously listed signs

### Special Note for Signage

---

The final advisory speeds and some sign types will have to be determined after the curve superelevation improvements and final surfacing operations have been completed. The Contractor shall notify the Engineer and District Traffic Engineer when all of the superelevation improvements and surfacing operations have been completed. Once notified, the District Traffic Engineer will ball-bank the newly surfaced curves to determine the appropriate advisory speeds and work with the Contractor to determine the final Signing Plan. The Engineer and/or District Traffic Engineer will provide the Contractor with the final advisory speeds, any changes to proposed sign types, and the final quantities within three (3) weeks of being notified by the Contractor that final surfacing operations are complete. After the Contractor has received this information from the Engineer and/or the District Traffic Engineer, the Contractor shall then proceed to layout and stake the signing according to the Special Note for Staking, included elsewhere in this Proposal.

All sign sheeting shall be from the Cabinet's List of Approved Materials.

All permanent signs and sign components shall be fabricated using Type XI sheeting.

The following signs and sign components shall be fabricated using Type XI fluorescent yellow sheeting:

- Horizontal Alignment Signs and Plaques, including signs shown in Figure 2C-1 of the MUTCD
- All Advisory Speed (W13-1P) plaques

The following signs shall be fabricated using Type XI fluorescent yellow-green sheeting:

- School and school bus warning signs, including the fluorescent yellow-green signs shown in Figures 7B-1 and 7B-6 of the MUTCD and other school-related warning signs that are not included in the MUTCD.
- Bicycle Warning (W11-1) signs and SHARE THE ROAD (W16-1P) plaques or diagonal downward pointing arrow (W16-7P) plaques that supplement Bicycle Warning signs.
- Pedestrian Warning signs and diagonal downward pointing arrow plaques that supplement Pedestrian Warning signs.
- In-Street Pedestrian Crossing (R1-6) signs and Overhead pedestrian Crossing (R1-9) signs
- Supplemental plaques to any of the previously listed signs

## **SECTION 02960**

### **TEMPORARY BYPASS PUMPING SYSTEMS**

#### **1.0 GENERAL**

##### **1.1 DESCRIPTION**

Section includes requirements for implementing a temporary pumping system for the purpose of diverting existing sewage flow around work area for duration of the project.

##### **1.2 QUALITY ASSURANCE**

1. Follow national standards and as specified herein.
2. Perform leakage and pressure tests on discharge piping using clean water, before operation. Contractor shall notify Owner & Engineer 24 hours prior to testing.
3. Maintain and inspect temporary pumping system every two hours. Contractor shall maintain an experienced and responsible operator on-site when bypass pump system is operating.
4. Keep and maintain spare parts for pumps and piping on site, as required.
5. Maintain adequate hoisting equipment, backup power supply, suction and discharge piping and appropriate accessories on-site for each pump within bypass pumping system.

##### **1.3 SUBMITTALS**

1. Contractor shall submit a detailed plan and description of proposed pumping system. Indicate number, size, material, location, and method of installation of suction and discharge piping, size of pipeline or conveyance system to be bypassed, staging area for pumps, site access point, and flow capacity of system.
  - a. Size and location of manhole or access points for suction and discharge hose or piping.
  - b. Sections showing suction and discharge pipe depth, embedment, select fill and special backfill, if buried.
  - c. Temporary pipe supports and anchoring, if required.
  - d. Thrust and restraint block sizes and locations, if necessary.
  - e. Sewer plugging method and type of plugs.
  - f. Bypass pump sizes, capacity, number of each size to be on site and power requirements.

- g. Backup pump, power and piping equipment that will be kept on-site.
- h. Calculations of static lift, friction losses, and flow velocity. Pump curves showing pump operating range.
- i. Design plans and access to bypass pumping locations are indicated on drawings.
- j. Calculations for selection of bypass pumping pipe size.
- k. Method of noise control for each pump and/or generator.
- l. Method of protecting discharge manholes or structures from erosion and damage.
- m. Schedule for installation and maintenance of bypass pumping lines.
- n. Procedures to monitor upstream mains for backup impacts.
- o. Procedures for setup and breakdown of pumping operations.
- p. Emergency plan detailing procedures to be followed in event of pump failures, sewer overflows, service backups, and sewage spillage. Contractor shall maintain a copy of their emergency plan on site for duration of project. All personnel assigned to monitor and operate the bypass pumping system shall have a thorough understand the emergency plan.

#### 1.4 CONTRACTORS RESPONSIBILITY FOR OVERFLOWS AND SPILLS

The contractor shall schedule and perform work in a manner that does not cause or contribute to incidence of overflows, releases, or spills of sewage from sanitary sewer system or bypass operation. Contractor will be responsible for reporting any overflows or spills to the proper permitting office. Any overflows or spills caused by any action of the contractor will be the responsibility of the contractor, including any fines levied for uncontrolled discharge.

#### 1.5 DELIVERY AND STORAGE

1. Contractor shall transport, deliver, handle, and store pipe, fittings, pumps, ancillary equipment, and all materials necessary to prevent damage to any of the products within the bypass pumping system and shall follow all manufacturer's recommendations.
2. Inspect all material and equipment for proper operation before initiating work. Any material found to be defective or damaged due to manufacturer or shipment of products shall be reported to the Owner & Engineer. If Owner or Engineer deems any product is not repairable or in conformance with these specifications, the contractor shall replace as directed before initiating work.
3. Repair or replacement of defective or damaged material and equipment shall be at no cost to utility or engineer.

## 2.0 PRODUCTS

### 2.1 MATERIALS

1. Discharge and Suction Pipes: Shall be approved by Engineer.
  - a. Discharge piping: Determined according to flow calculations and system operating calculations.
  - b. Suction piping: Determined according to pump size, flow calculations, and manhole depth following manufacturer's specifications and recommendations.
2. Polyethylene Plastic Pipe.
  - a. High density solid wall and following ASTM F714 Polyethylene (PE) Plastic Pipe (SDR-DR) based on Outside Diameter, ASTM D1248 and ASTM D3550
  - b. Homogenous throughout, free of visible cracks, discoloration, pitting, varying wall thickness, holes, foreign material, blisters, or other deleterious faults.
3. High-Density Polyethylene (HDPE).
  - a. Homogenous throughout, free of visible cracks, discoloration, pitting, varying wall thickness, holes, foreign material, blisters, or other deleterious faults.
    1. Defective areas of pipe: Cut out and joint fused as stated herein.
    - b. Assembled and joined at site using couplings, flanges, or butt-fusion method to provide leak proof joint. Follow manufacturer's instructions and ASTM D 2657.
    2. Threaded or solvent joints and connections are not permitted.
    - c. Fusing: By personnel certified as fusion technicians by manufacturer of HDPE pipe and/or fusing equipment.
    - d. Butt-fused joint: True alignment and uniform roll-back beads resulting from use of proper temperature and pressure.
  1. Allow adequate cooling time before removal of pressure.
  2. Watertight and have tensile strength equal to that of pipe
  3. Acceptance by Engineer before insertion
    - e. Use in streams, storm water culverts and environmentally sensitive areas.
4. Flexible Hoses and Associated Couplings and Connectors.
  - a. Abrasion resistant.
  - b. Suitable for intended service.
  - c. Rated for external and internal loads anticipated, including test pressure.
    1. External loading design: Incorporate anticipated traffic loadings, including traffic impact loading.
  - d. When subject to traffic loading, compose system, such as traffic ramps

or covers.

1. Install system and maintain H-20 loading requirements while in use or as directed by the Engineer.
5. Valves and Fittings: Determined according to flow calculations, pump sizes previously determined, and system operating pressures.
6. Plugs: Selected and installed according to size of line to be plugged, pipe and manhole configurations, and based on specific site.
  - a. Additional plugs shall be available in the event a plug fails. Plugs will be inspected by owner and engineer or engineers representative before use for defects which may lead to failure.
7. Aluminum "irrigation type" piping or glued PVC piping will not be permitted.
8. Discharge hose will only be allowed in short sections when approved by Engineer.

## 2.2 EQUIPMENT

1. Pumps.
  - a. Fully automatic self-priming units that do not require the use of foot-valves or vacuum pumps in priming system.
  - b. Electric or diesel powered.
  - c. Constructed to allow dry running for long periods of time to accommodate cyclical nature of effluent flows.
2. Provide.
  - a. Necessary stop/start controls for each pump.
  - b. One standby pump of each size maintained on site.
    1. On-line, isolated from primary system by a valve.
  - c. Quiet flow pumps at request of Owner or Engineer.

## 2.3 DESIGN REQUIREMENTS

1. Bypass pumping systems:
  - a. Sufficient capacity to pump peak flow of **100 GPM**.
2. Engineer will provide flow data for bypass system.
  - a. Contractor shall have in place staff for manual operation or automatic pump controls to maintain operation of bypass pumping. Pumps to be operated as needed, with the capacity to operate 24 hours per day, if necessary.
3. Provide pipeline plugs and pumps of adequate size to handle peak flow, and temporary discharge piping to ensure total flow of main can be safely

diverted around section to be repaired/replaced/constructed.

### **3.0 EXECUTION**

#### **3.1 PREPARATION**

1. Determining location of bypass pipelines.
  - a. Minimal disturbance to existing utilities.
    1. Field locate existing utilities in proposed bypass area.
  - b. Obtain approvals for placement within public or private property.
  - c. Obtain Owner and Engineer's approval of location.
  - d. Costs associated with relocation of utilities and obtaining approvals will be at no cost to the utility or engineer.

#### **3.2 INSTALLATION AND REMOVAL**

1. Provisions and requirements must be reviewed by Engineer before starting construction.
2. Remove manhole sections or make connections to existing sewer and construct temporary bypass pumping structures at location(s) indicated on Drawings and as required to provide adequate suction conduit.
3. Plugging or blocking of sewage flows shall incorporate a primary and secondary plugging device. When plugging or blocking is no longer needed for performance and acceptance of work, remove in a manner that permits the sewage flow to slowly return to normal without surge, to prevent surcharging or causing other major disturbances downstream.
4. When working inside manhole or force main, exercise caution. Contractor shall closely follow all OSHA, Local, State and Federal requirements as applicable. Take required measures to protect workforce against sewer gases and/or combustible or oxygen-deficient atmosphere. Contractor is solely responsible for jobsite safety.
5. Installation of Bypass Pipelines:
  - a. Pipeline may be placed along shoulder of roads.
    1. Do not place in streets or sidewalks.
  - b. When bypass pipeline crosses local streets and private driveways, place in roadway ramps, or as directed by Engineer.
    1. When roadway ramps cannot be used, place bypass in trenches and cover with temporary pavement or road plates as approved by Engineer.
6. During bypass pumping operation, protect pumps and sewer lines from damage that may be inflicted by equipment or vandalism. Contractor shall

erect berms, barricades, or temporary fencing as necessary to protect bypass pumping system and discourage or prevent entry by unauthorized personnel. Contractor is solely responsible for jobsite security and controlled access.

7. Upon completion of bypass pumping operations, and after the receipt of written permission from Engineer, remove piping, restore property to pre-construction condition and restore pavement.

**END OF SECTION 02960**

## SECTION 15103

### PRESSURE TESTING AND STERILIZATION

#### 1.0 TESTING

1.1 After the pipe has been laid, all newly laid pipe or any valved section thereof shall be subjected to a hydrostatic pressure test of at least 1.5 times the working pressure at the point of testing, but in no case less than that required by other Sections herein. In addition, a leakage test shall be conducted concurrently with the pressure test.

#### 1.2 PRESSURE TEST

A. Test pressure shall:

1. Not be less than 1.25 times the working pressure at the highest point along the test section.
  2. Not exceed pipe or thrust restraint design pressures at the lowest point along the test section.
  3. Be of at least six (6) hour duration unless otherwise stipulated by Owner.
  4. Not vary by more than plus or minus 5 psi.
  5. Not exceed twice the rated pressure of the valves or hydrants when the pressure of the test section includes closed gate valves or hydrants.
  6. Not exceed the rated pressure of resilient seat butterfly valves when used.
- B. Each valved section of pipe shall be filled with water slowly and the specified test pressure, based on the elevation of the lowest point of the line or section under test and corrected to the elevation of the test gauge, shall be applied by means of a pump connected to the pipe in a manner satisfactory to the Engineer.
- C. Before applying the specified test pressure, air shall be expelled completely from the pipe, valves, and hydrants. If permanent air vents are not located at all high points, the contractor shall install corporation cocks at such points so that the air can be expelled as the line is filled with water. After all the air has been expelled, the corporation cocks shall be closed and the test pressure applied. At the conclusion of the pressure test, the corporation cocks shall be removed and plugged, or left in place at the discretion of the Engineer.
- D. All exposed pipe, fittings, valves, hydrants, and joints shall be examined carefully during the test. Any damage or defective pipe,

fittings, valves, hydrants or other appurtenances that are discovered during or following the pressure test shall be repaired or replaced with sound equipment and materials, and the test shall be repeated until all test results are satisfactory in the opinion of the Engineer.

### 1.3 LEAKAGE TESTING

- A. Leakage shall be defined as the quantity of water that must be supplied into the newly laid pipe, or any valved section thereof, to maintain pressure within 5 psi of the specified test pressure after the air in the pipeline has been expelled and the pipe has been filled with water.
- B. No pipe installation will be accepted if the leakage is greater than that determined by the following formula:

$$\frac{\sqrt{ND}}{P}$$

ND P

in which L is the allowable leakage, 100 gallons per hour; N is the length of pipeline tested in feet; D is the nominal diameter of the pipe, in inches; and P is the average test pressure during the leakage test, in pounds per square inch gauge.

1. Allowable leakage at various pressures is shown in Table K-1.
  2. When testing against closed metal-seated valves, an additional leakage per closed valve of 0.0078 gal/hr/in of nominal valve size shall be allowed.
  3. When hydrants are in the test section, the test shall be made through the open isolation valve and against the closed hydrant valve.
- C. Acceptance shall be determined on the basis of allowable leakage. If any test of pipe laid discloses leakage greater than that specified in Section 1.03.B the Contractor shall, at his own expense, locate and repair the defective material until the leakage is within the specified allowance.

All visible leaks are to be repaired regardless of the amount of leakage.

**Table K-1**  
**Allowable Leakage Per 1,000 Ft. Of Pipeline (GPH)**

Avg. Test Pressure (psi)	Nominal Pipe Diameter (Inches)								
	2	3	4	6	8	10	12	14	16
450	0.32	0.48	0.64	0.95	1.27	1.59	1.91	2.23	2.55
400	0.30	0.45	0.60	0.90	1.20	1.50	1.80	2.10	2.40

100	1.35	1.50	1.80	2.25	2.70	3.15	3.60	4.05

## 2.0 STERILIZATION

### 2.1 GENERAL

It is the intent of this Section to present essential procedures for disinfecting new and repaired water mains. This Section is patterned after AWWA C651. The basic procedure comprises:

- A. Preventing contaminating materials from entering the water mains during construction or repair and removing by flushing materials that may have entered the water main.
- B. Disinfecting any residual contamination that may remain.
- C. Determining the bacteriologic quality by laboratory test after disinfection.

## 2.2 PREVENTIVE MEASURES DURING CONSTRUCTION

- A. Precautions shall be taken to protect pipe interiors, fittings, and valves against contamination. Pipe delivered for construction shall be strung so as to minimize entrance of foreign material. When pipe laying is not in progress, for example at the close of the day's Work, all openings in the pipe line shall be closed by water tight plugs. Joints of all pipe in the trench shall be completed before Work is stopped. If water accumulates in the trench, the plugs shall remain in place until the trench is dry.

If dirt that, in the opinion of the Engineer, will not be removed by the flushing operation (Section 2.3) enters the pipe, the interior of the pipe shall be cleaned and swabbed as necessary, with a five (5%) percent hypochlorite disinfecting solution.

- B. Packing Materials and Joints—No contaminated material or any material capable of supporting prolific growth of micro-organisms shall be used for sealing joints. Packing material shall be handled in such a manner as to avoid contamination. Where applicable, packing materials must conform to AWWA standards. Packing material for cast iron pipe must conform to AWWA C600. Yarning or packing material shall consist of molded or tubular rubber rings, rope of asbestos or treated paper. Materials such as jute or hemp shall not be used. The lubricant used in the installation of sealing gaskets shall be suitable for use in potable water. It shall be delivered to the job in enclosed containers and shall be kept clean.

## 2.3 PRELIMINARY FLUSHING

The main shall be flushed prior to disinfection unless disinfected by the method in Section 2.04.B.1. It is recommended that the flushing velocity be not less than 2.5 ft/sec. The rate of flow required to produce this velocity in various diameters

is shown in Table K-2. No site for flushing should be chosen unless it has been determined that drainage is adequate at the site.

**Table K-2**  
**Required Openings To Flush Pipelines**  
**(40-PSI Residual Pressure)**

Pipe Size (in.)	Flow Required to Produce 2.5 fps Velocity (gpm)	Orifice Size (in.)	Hydrants Required	
			Number of Hydrants	Nozzle Size (in.)
4	100	15/16	1	2 1/2
6	220	1 3/8	1	2 1/2
8	390	1 7/8	1	2 1/2
10	610	2 5/16	1	2 1/2
12	880	2 13/16	1	2 1/2
14	1,200	3 1/4	2	2 1/2
16	1,565	3 5/8	2	2 1/2
18	1,980	4 3/16	2	2 1/2

## 2.4 FORM OF CHLORINE FOR DISINFECTION

The most common forms of chlorine used in the disinfecting solutions are liquid chlorine (gas at atmospheric pressure), calcium hypochlorite granules, and sodium hypochlorite solutions.

### A. Liquid Chlorine

1. Use: Liquid chlorine shall be used only when suitable equipment is available and only under the direct supervision of a person familiar with the physiological, chemical, and physical properties of this element and who is properly trained and equipped to handle any emergency that may arise. Introduction of chlorine-gas directly from the supply cylinder is unsafe and shall not be permitted.

NOTE: The preferred equipment consists of a solution fed chlorinator in combination with a booster pump for injecting the chlorine-gas water mixture into the main to be disinfected. Direct feed chlorinators are not recommended because their use is limited to situations where the water pressure is lower than the chlorine cylinder pressure.

### B. Hypochlorites

1. Calcium Hypochlorite: Calcium hypochlorite contains seventy (70%) percent available chlorine by weight. It is either granular or tabular in form. The tablets, 6-8 to the ounce, are designed to dissolve slowly in water. Calcium hypochlorite is packaged in containers of various types and sizes ranging from small plastic bottles to one hundred (100) pound drums.

A chlorine-water solution is prepared by dissolving the granules in water in the proportion requisite for the desired concentration.

2. Sodium Hypochlorite: Sodium hypochlorite is supplied in strengths from five and one-quarter (5.25%) to sixteen (16%) percent available chlorine. It is packaged in liquid form in glass, rubber, or plastic containers ranging in size from one (1) quart bottles to five (5) gallon carboys. It may also be purchased in bulk for delivery by tank truck.

The chlorine-water solution is prepared by adding hypochlorite to water. Product deterioration must be reckoned with in computing the quantity of sodium hypochlorite required for the desired concentration.

3. Application: The hypochlorite solutions shall be applied to the water main with a gasoline or electrically powered chemical feed pump designed for feeding chlorine solutions. For small applications, the solutions may be fed with a hand pump, for example, a hydraulic test pump. Feed lines shall be of such material and strength as to withstand safely the maximum pressures that may be created by the pumps. All connections shall be checked for tightness before the hypochlorite solution is applied to the main.

## 2.5 METHODS OF CHLORINE APPLICATION

- A Continuous Feed Method: This method is suitable for general application.

1. Water from the existing distribution system or other approved sources of supply shall be made to flow at a constant, measured rate into the newly-laid pipe line. The water shall receive a dose of chlorine, also fed at a constant, measured rate. The two rates shall be proportioned so that the chlorine concentration in the water in the pipe is maintained at a minimum of 50 mg/L available chlorine. To assure that this concentration is maintained, the chlorine residual should be measured at regular intervals in accordance with the procedures described in the current edition of Standard

Methods and AWWA M12—Simplified Procedures for Water Examination.

NOTE: In the absence of a meter, the rate may be determined either by placing a pitot gauge at the discharge or by measuring the time to fill a container of known volume.

Table K-3 gives the amount of chlorine residual required for each one hundred (100) feet of pipe of various diameters. Solutions of one (1%) percent chlorine may be prepared with sodium hypochlorite or calcium hypochlorite. The latter solution requires approximately one pound (1 lb.) of calcium hypochlorite in eight and five tenths (8.5) gallons of water.

**Table K-3**  
**Chlorine Required To Produce 50 mg/L Concentration**  
**In 100 Ft. Of Pipe (By Diameter)**

Pipe Size (in.)	100 Percent Chlorine (lb)	1 Percent Chlorine Solutions (gal)
4	0.027	0.33
6	0.061	0.73
8	0.108	1.30
10	0.170	2.04
12	0.240	2.88

2. During the application of the chlorine, valves shall be manipulated to prevent the treatment dosage from flowing back into the line supplying the water. Chlorine application shall not cease until the entire main is filled with the chlorine solution. The chlorinated water shall be retained in the main for at least twenty-four (24) hours during which time all valves and hydrants in the section treated shall be operated in order to disinfect the appurtenances. At the end of this twenty-four (24) hour period, the treated water shall contain no less than 25 mg/L chlorine throughout the length of the main.
- B. Slug Method: This method is suitable for use with mains of large diameter for which, because of the volumes of water involved, the continuous feed method is not practical.
  1. Water from the existing distribution system or other approved source of supply shall be made to flow at a constant, measured rate (see section 2.5.1.1) into the newly laid pipe line. The water

shall receive a dose of chlorine also fed at a constant, measured rate. The two rates shall be proportioned so that the concentration in the water entering the pipe line is maintained at no less than 300 mg/L. The chlorine shall be applied continuously and for a sufficient period to develop a solid column or "slug" of chlorinated water that will, as it passes along the line, expose all interior surfaces to a concentration of at least 300 mg/L for at least three (3) hours. The application shall be checked at a tap near the upstream end of the line by chlorine residual measurements.

2. As the chlorinated water flows past tees and crosses, related valves and hydrants shall be operated as to disinfect appurtenances.

## 2.6 FINAL FLUSHING

- A. After the applicable retention period, the heavily chlorinated water shall be flushed from the main until the chlorine concentration in the water leaving the main is no higher than that generally prevailing in the system, or less than 1 mg/L. Chlorine residual determination shall be made to ascertain that the heavily chlorinated water has been removed from the pipeline.
- B. Disposing of Heavily Chlorinated Water. The environment into which the chlorinated water is to be discharged shall be inspected. If there is any possibility that the chlorinated discharge will cause damage to the environment, then a neutralizing chemical shall be applied to the water to be wasted to neutralize thoroughly the chlorine residual remaining in the water. See Table K-4 for neutralizing chemicals. Federal, state, provincial, and local regulatory agencies should be contacted to determine special provisions for the disposal of heavily chlorinated water.

**Table K-4**  
**Amount of Chemicals Required to Neutralize Various Residual Chlorine Concentrations in 100,000 Gallons of Water**

Residual Chlorine Concentration <i>mg/L</i>	Sulfur Dioxide (SO <sub>2</sub> )		Sodium Bisulfate (NaHSO <sub>3</sub> )		Sodium Sulfite (Na <sub>2</sub> SO <sub>3</sub> )		Sodium Thiosulfate (Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> • 5H <sub>2</sub> O)	
	<i>lb</i>	<i>kg</i>	<i>lb</i>	<i>kg</i>	<i>lb</i>	<i>kg</i>	<i>lb</i>	<i>kg</i>
1	0.8	0.36	1.2	0.54	1.4	0.64	1.2	0.54
2	1.7	0.77	2.5	1.13	2.9	1.32	2.4	1.09
10	8.3	3.76	12.5	5.67	14.6	6.62	12.0	5.44
50	41.7	18.91	62.6	28.39	73.0	33.11	60.0	27.22

## **2.7 BACTERIOLOGIC TESTS**

1. After final flushing, and before the water main is placed in service, a sample or samples shall be collected from the end of the line and tested for bacteriologic quality and shall show the absence of coliform organisms. If the number and frequency of samples is not prescribed by the public health authority having jurisdiction, at least one (1) sample shall be collected from chlorinated supplies where a chlorine residual is maintained throughout the new main. From unchlorinated supplies at least two (2) samples shall be collected at least twenty-four (24) hours apart.
2. Samples for bacteriologic analysis shall be collected in sterile bottles treated with sodium thiosulphate. No hose or fire hydrant shall be used in collection of samples. A suggested sampling tap consists of a standard corporation cock installed in the main with a copper tube gooseneck assembly. After samples have been collected, the gooseneck assembly may be removed, and retained for future use.

## **2.8 REPETITION OF PROCEDURE**

If the initial disinfection fails to produce satisfactory samples, disinfection shall be repeated until satisfactory samples have been obtained. The tablet method cannot be used in these subsequent disinfections. When the sample tests indicate that disinfection has been effective, the main may be placed in service.

## **2.9 PROCEDURE AFTER CUTTING INTO OR REPAIRING EXISTING MAINS**

The procedures outlined in this Section apply primarily when mains are wholly or partially dewatered. Leaks or breaks that are repaired with clamping devices while the mains remain full of water under pressure present little danger of contamination and require no disinfection.

- A. Trench "Treatment": When an old line is opened, either by accident or by design, the excavation will likely be wet and may be badly contaminated from nearby sewers. Liberal quantities of hypochlorite applied to open trench areas will lessen the danger from such pollution. Tablets have the advantage in such a situation because they dissolve slowly and continue to release hypochlorite as water is pumped from the excavation.
- B. Main Disinfection: The following procedure is considered as a minimum that may be used.

1. Swabbing With Hypochlorite Solution: The interior of all pipe and fittings used in making the repair (particularly couplings and tapping sleeves) shall be swabbed with a five (5%) percent hypochlorite solution before they are installed.
  2. Flushing: Thorough flushing is the most practical means of removing contamination introduced during repairs. If valving and hydrant locations permit, flushing from both directions is recommended. Flushing shall be started as soon as the repairs are completed and continued until discolored water is eliminated.
  3. Slug Method: Where practicable, in addition to the procedures of section 2.9.2.1, a section of main in which the break is located shall be isolated, all service connections shut off, and the section flushed and chlorinated as described in section 2.5.2, except that the dose may be increased to as much as 500 mg/L, and the contact time reduced to as little as one-half (1/2) hour. After chlorination, flushing shall be resumed and continued until discolored water is eliminated.
- C. Sampling: Bacteriologic samples shall be taken after repairs to provide a record by which the effectiveness of the procedures used can be determined. If the direction of flow is unknown, samples shall be taken on each side of the main break.

### **3.0 PAYMENT**

No separate payment shall be made for testing and sterilization of water lines. Items described in this Section shall be incidental to the cost of installing the water line.

**END OF SECTION 15103**

\*ANNUAL AVERAGE DAILY TRAFFIC \*\*PASSENGER CARS PER LANE

TYPE VI CLASS T CRASH CUSHIONS ARE TEMPORARY DEVICES USED IN WORK ZONES AS PART OF TEMPORARY TRAFFIC CONTROL TO SHIELD THE BLUNT ENDS OF RIGID OBJECTS, SUCH AS TEMPORARY CONCRETE BARRIERS.

WHEN INSTALLING A CRASH CUSHION TYPE VI CLASS T, CONTRACTORS MAY SELECT ANY DEVICE FROM THE APPROVED SYSTEMS LIST ABOVE, PROVIDED THE SELECTED SYSTEM MEETS THE TEST LEVEL SPECIFIED IN THE PLANS AND IS APPROPRIATE FOR THE WORK ZONE CONTEXT.

~ NOTES ~

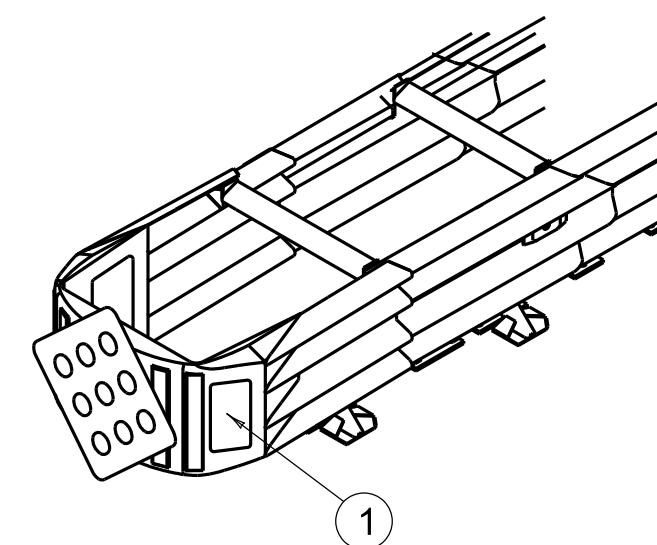

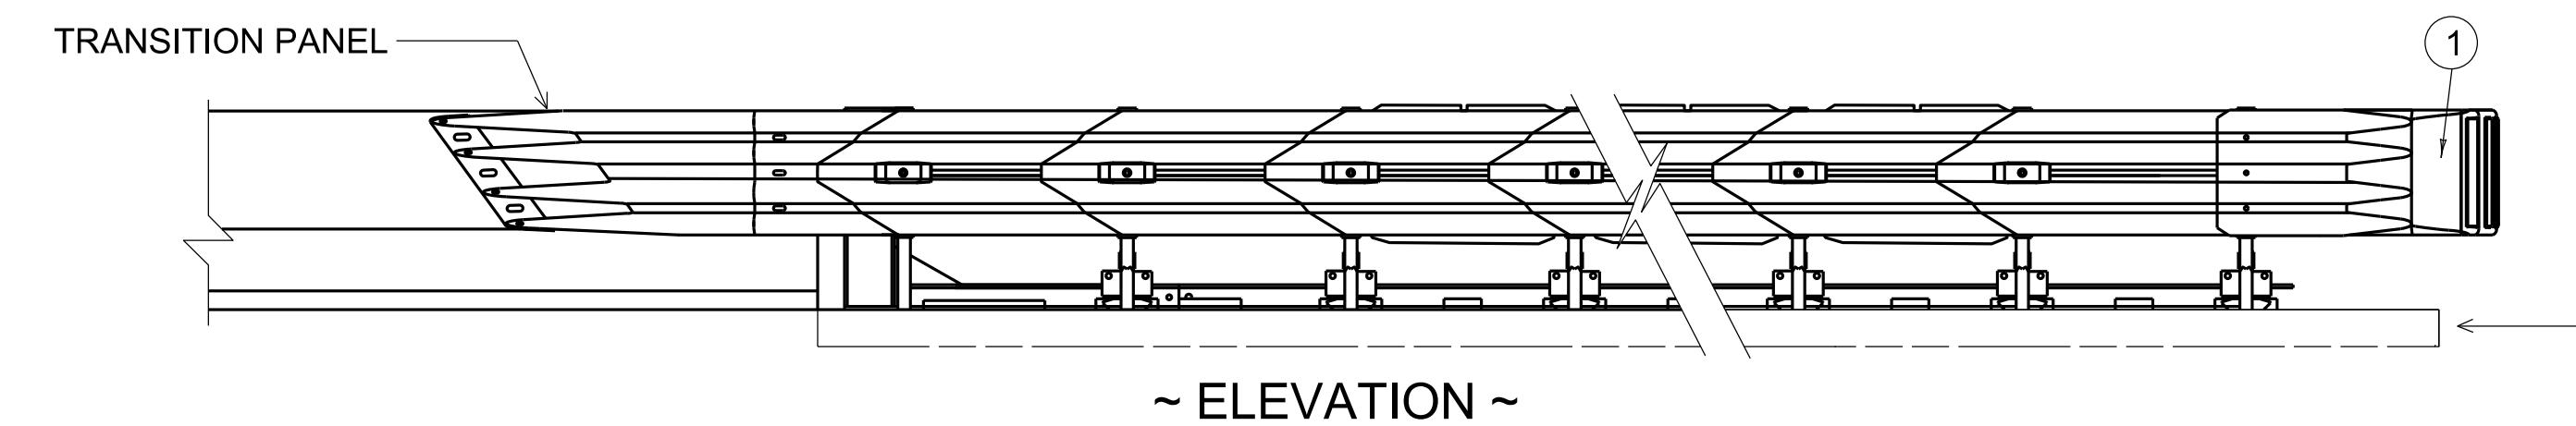

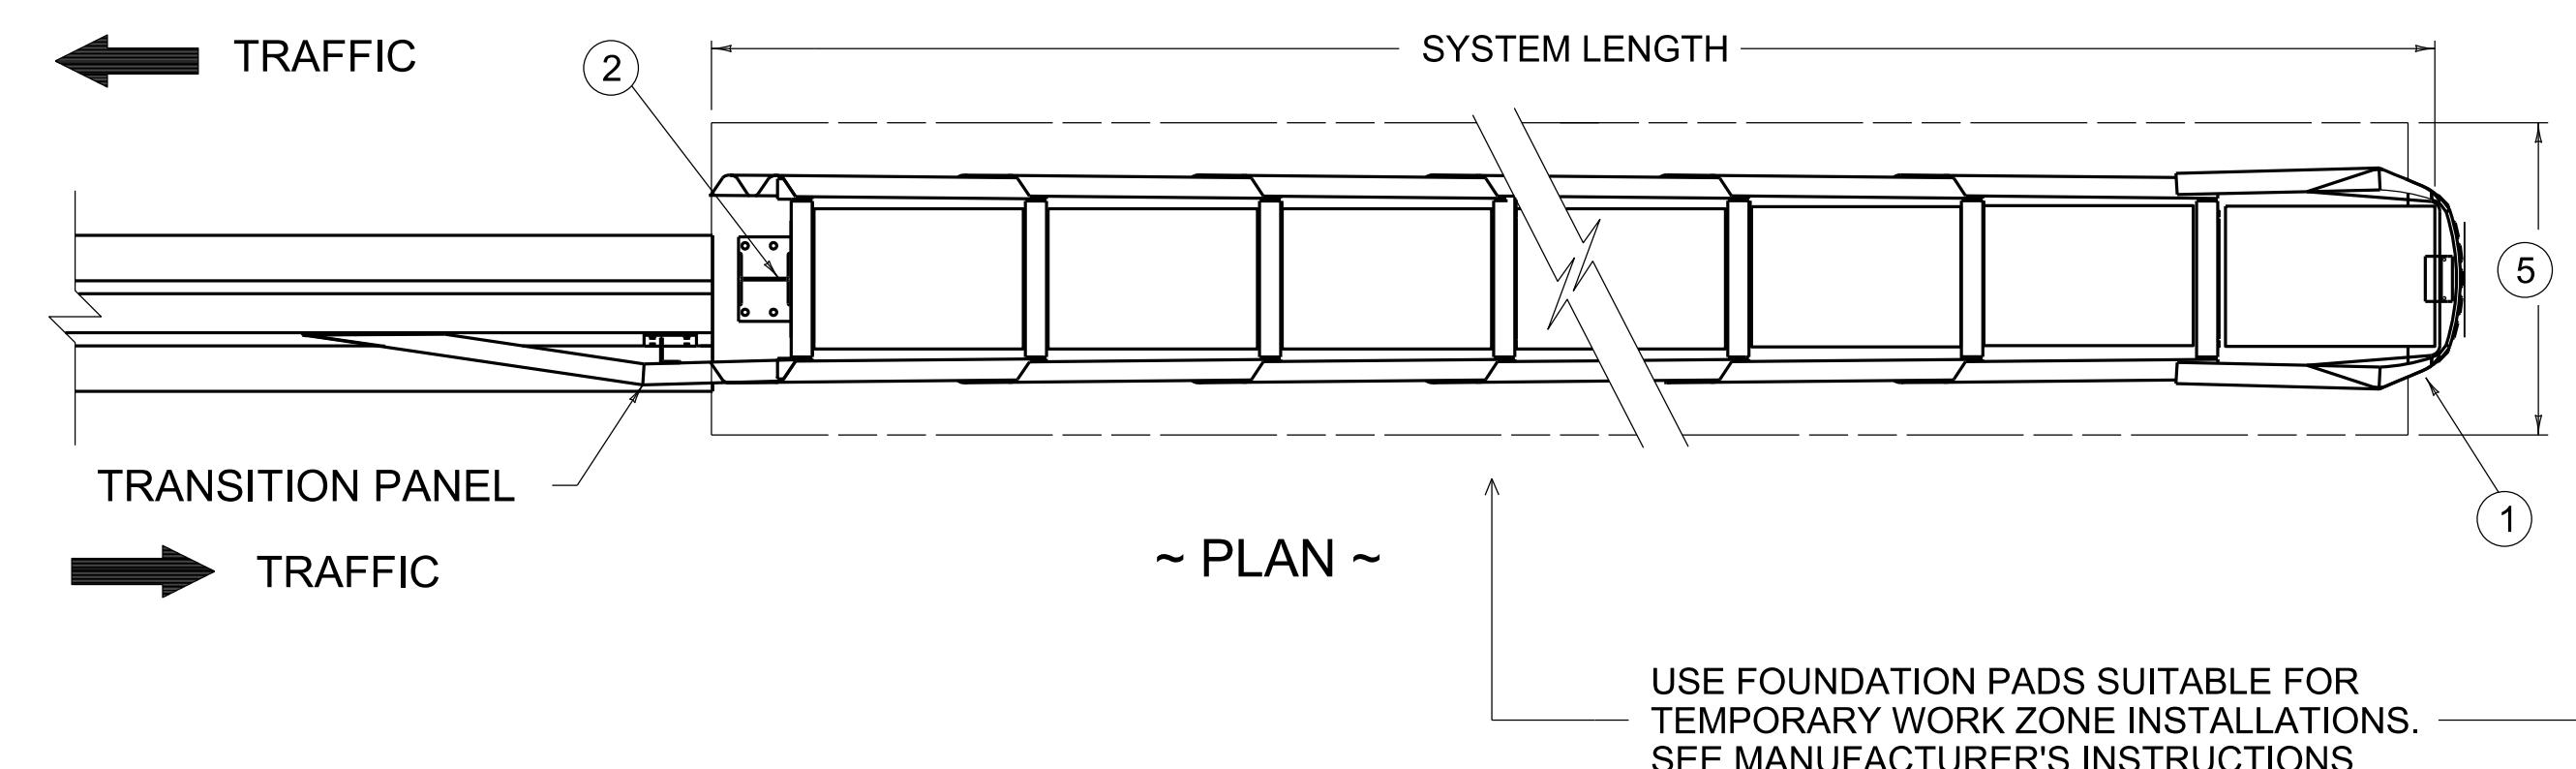

- ① NOSE ASSEMBLY (OBJECT MARKER TYPE 1 AS REQUIRED)
- ② CONSTRUCTION ZONE BACKUP ASSEMBLY PER MANUFACTURER'S ASSEMBLY INSTRUCTIONS
3. IN THE DRAWING ABOVE, THE CRASH CUSHION TYPE VI-T IS SHOWN ATTACHED TO A TEMPORARY CONCRETE BARRIER.
4. CONSULT THE PLANS TO DETERMINE THE TRAFFIC DIRECTION AND THE TYPE OF BARRIER OR ROADWAY FEATURE BEING SHIELDED BY THE CRASH CUSHION. REFER TO THE MANUFACTURER'S ASSEMBLY INSTRUCTIONS FOR TRANSITION DESIGN AND CRASH CUSHION INSTALLATION DETAILS. SELECT THE APPROPRIATE TRANSITION TYPE AND ALL NECESSARY COMPONENTS FOR INSTALLATION. ALL WORK AND MATERIALS RELATED TO THE TRANSITION ARE INCIDENTAL TO THE CRASH CUSHION TYPE VI-T BID ITEM.
5. PREPARE THE SITE AND INSTALL FOUNDATION PADS SUITABLE FOR TEMPORARY WORK ZONES IN ACCORDANCE WITH MANUFACTURER SPECIFICATIONS. FOLLOW MANUFACTURER INSTRUCTIONS FOR MATERIALS, THICKNESS, SPECIFICATIONS, AND ANCHORING. ALL WORK AND MATERIALS RELATED TO THE FOUNDATION PAD ARE INCIDENTAL TO THE CRASH CUSHION TYPE VI-T BID ITEM.
6. WHEN REQUIRED BY THE PLANS OR ENGINEER, RELOCATE CRASH CUSHION TYPE VI CLASS T AS DIRECTED. THE BID ITEM 'RELOCATE CRASH CUSHION' INCLUDES THE UNIT'S REMOVAL AND RE-INSTALLATION.
7. CRASH CUSHION TYPE VI CLASS T INSTALLATIONS SHALL FOLLOW THE MANUFACTURER'S INSTRUCTIONS. SYSTEMS SHALL NOT BE MODIFIED FROM THEIR APPROVED CONFIGURATIONS.
