

Collision Data Dictionary

This data dictionary lists each field collected on the Kentucky Collision Report. This includes definition of the fields, validation edits of values assigned to fields, the database properties of the associated fields, where the field can be found within the E-Crash wizard, where the field can be found within the E-Crash printed report, and collision database diagrams.

Date Created: September 2019

Created By: Steven Roadcap & Megan Minogue (LexisNexis Risk Solutions) for Kentucky State Police.

Introduction

Things to Note:

Default Values: If a field has a default value, a predetermined value is set for said field automatically upon opening the screen. A field may be required but if there is a default value set, then an officer can proceed to the next screen without ever changing the value of the fields with default values. Not all fields have default values and in these cases, an officer cannot complete the screen without actively selecting and/or entering values for the field if it is required.

DataSource: Some fields, mostly fields set by combo boxes, have “data sources”. This data source is simply a table and the user is only allowed to make a selection from that table for the field in question.

Table Relationships: There are many tables involved in the Collision database. Some have a one-to-many relationship and some have a one-to-one relationship. This affects the data and how the data can be queried and interpreted. Please see Appendix E for a relationship diagram of the tables.

Values Set Server Side

The values set by the server include the primary keys of each table. When a new collision is inserted in the database, most tables will have a unique primary key created for each new row. This is called an identity column. This primary key can also be used as a foreign key in other tables to help link tables together. For example, 'IncidentID' is the primary key for the *Incident* table and the column 'IncidentID' can also be found in the *Narrative* table as a foreign key to link a specific narrative row in the *Narrative* table to a specific incident in the *Incident* table.

See the Table Breakdown¹ for each table's primary and foreign keys.

Location Screen

The screenshot shows a software window titled "Collision Location". Inside, there's a section labeled "LOCATION". The form includes fields for "Description", "County / City" (with a dropdown for "Co." and a text field for "City"), and "Lat: Deg. Min. Sec." and "Lng: Deg. Min. Sec." with corresponding input boxes. A "Map It" button is next to the City field. Below this, the "Incident Roadway" section has fields for "Street#", "Dir", "Street Name", "Roadway #", "Route Suffix?", "Suffix", "Sector", "State", "Zip", "Location Type" (with a dropdown menu showing "HIGHWAY, ROAD, ALLEY (INCLUDE)", "Mile Point", "Local Rdwy", and "Map Segment", and "Apt#". There are radio buttons for "Map - Allow User Entry?" (set to "NO"), "Roadway Only?", "Intersection?", "Between Streets?", and "Ramp?". Below these are sections for "2nd Roadway" and "3rd Roadway", each with fields for "Ramp From Dir", "Dir", "Roadway #", "Route Suffix?", "Suffix", "Street Name", "Street Sfx", and "Ramp To Dir". At the bottom, there's a "Navigation" button and a row of buttons: "Print Info Sheet", "View History", "Display", "Save", "Cancel", "<Prev", "Next>", and "Finished".

Screen Shot of Location Screen using test account (last updated June 2019)

The Location Screen captures data concerning the specific location of the collision. Below are the definitions and details of the information captured by this screen.

Things to Note:

MapIt Form: The MapIt Form is a form with an interactive map that allows the user to pick a point on the map where the Collision occurred, confirm the correct street/streets are selected, and then populates the appropriate Location Screen fields accordingly. This feature is used more often than manual entry, as it is more accurate and saves the user time.

Allow User Entry: "Allow User Entry" is a Boolean, TRUE/FALSE, value that controls whether the user can manually enter the location or not. This value is mostly FALSE as using MapIt is more accurate and saves time. However, it can be set two TRUE under two circumstances: the location chosen in the Map It Form is a ramp OR the user selects a box in the MapIt Form called 'Allow User Entry'. When this value is set to TRUE, most of the fields become enabled for user edit and entry whereas when the value is FALSE, only 4-5 fields are enabled for manual user input.

Screen Shot of Location Details Screen using test account (last updated June 2019)

The Location Details Screen gathers details about the location of the crash beyond the type of roadway and map location such as speed limit, whether the street the collision occurred on was a one-way, etc. Below are the definitions and details of the information captured by this screen.

Things to Note:

MapIt Form: The MapIt Form is a form from the Location Screen with an interactive map that allows the user to pick a point on the map where the Collision occurred, confirm the correct street/streets are selected, and then populates the appropriate Location Screen fields accordingly. This feature is used more often than manual entry, as it is more accurate and saves the user time.

Allow User Entry: "Allow User Entry" is a Boolean, TRUE/FALSE, value set on the Location Screen that controls whether the user can manually enter the location or not. This value is mostly FALSE as using MapIt is more accurate and saves time. However, it can be set two TRUE under two circumstances: the location chosen in the Map It Form is a ramp OR the user selects a box in the MapIt Form called 'Allow User Entry'. When this value is set to TRUE, most of the fields become enabled for user edit and entry whereas when the value is FALSE, only 4-5 fields are enabled for manual user input.

- Vehicle Year has to be 4 characters.

- Year indicator in the VIN is compared to this value. If there is a discrepancy, the Vehicle Year is not rejected but a warning is flashed. The Year Indicator in the VIN is in the 10th position (first character of the VIN being the 1st). That value is found in the following string 'ABCDEFGHJKLMNPSTVWXY123456789'. For example, if the Vin's year indicator is 1 and 1 can be found in position 22 of the above string. Therefore, 22 is added to 2009 and 1979 and if that result doesn't match the Vehicle Year then a warning is given.)

Compute Directional Analysis

The below outlines how any given Directional Analysis Code (Collision.DirAnalysisCde) is calculated in the back end.

Things to Note

- Many of the conditions are determined by the values of other tables and columns. Other values are noted by their table and then column name with a period between. For example: 'Collision.CollisionUnits' is a reference to the value in the column 'CollisionUnits' in the table 'Collision'.
- Each of the bullet points to the right of a code MUST be true for the code to be set as the Collision.DirAnalysisCde for any given collision.
