SUMMARY

The condition of the MP road system has deteriorated in recent years. Statewide, the percentage of MP roadway miles in poor condition is at an all-time high of 21%. This can be primarily attributed to a decrease in the number of miles resurfaced. At the current rate, it will take nearly 18 years to resurface the entire MP system. Using existing strategies, this cycle length is unsustainable. Unless changes are made in both funding and treatment strategy, the percentage of poor MP pavements can be expected to reach 30% to 40% within the next few years.

In contrast, the RS road system has seen significant improvements over the past few years. The percentage of poor pavements on RS roads has decreased from a high of 20% in 2001 to an all-time low of 9% in 2007. This decrease is due to the relatively low resurfacing cycle on the RS system. Since 2004, the RS resurfacing cycle length has averaged 13.7 years. However, this increased in 2007 to 16.3 years.

The discrepancy in resurfacing cycles on the MP and RS systems is due primarily to dramatic increases in costs on the MP system. Recent oil price increases have had a greater impact on MP resurfacing costs. In 2007, the average cost to resurface MP roads was \$111,800 per mile, while RS costs averaged \$58,000.

Continued increases in resurfacing costs will necessitate a shift in pavement management policy. Rather than focusing entirely on those pavements in the worst condition, Kentucky should emphasize a strategy of continued maintenance throughout the life of pavements. By performing preventive maintenance treatments on roads which are still in fair condition, the entire system can be improved at a lower total cost. However, these improvements will not be realized immediately, and increased funding for resurfacing will still be necessary.

It is recommended that the annual resurfacing program budget be increased to approximately \$116 million for the MP system and \$55.5 million for RS. These funding levels will result in a 14 year resurfacing cycle for the MP system and a 15 year resurfacing cycle for the RS system. Separately, annual preventive maintenance funding should be made available at \$5 million for MP and \$3 million for RS. Over time, resurfacing cycles can be allowed to increase slightly as more preventive maintenance treatments are applied. However, smaller increases in resurfacing funding will still be required due to rising costs.

INTRODUCTION

The “Condition of Pavements on Kentucky Highways: MP and RS Edition” presents data related to the rideability and general condition of pavements on Kentucky’s state-maintained roadway system. This report pertains exclusively to the MP (State Primary, State Secondary, and Supplemental Roads) and RS Systems (Rural Secondary Roads). Information regarding the condition of pavements on Interstates and Parkways in Kentucky is provided separately in “Condition of Pavements on Kentucky Highways: Interstate and Parkway Edition”.

Included is historical information on annual resurfacing; resurfacing needs and funding; rideability, general condition, and other pertinent information for each system. A description of the testing method for rideability as well as the criteria and procedures employed in estimating the general condition of pavements can be found in “Pavement Management in Kentucky: An Overview in Year 2003”.

In 2007, the MP System consisted of 13,229 paved roadway miles, while the RS System had 12,826 miles. As illustrated in **Figure 1**, the MP and RS Systems make up the vast majority of state-maintained roadway mileage.

The Kentucky Transportation Cabinet’s Department of Highways is divided into twelve geographic districts comprised of between seven to twelve counties each. District locations are shown in **Figure 2** on the following page. This report will include data for both statewide and district information.

Figure 1: State Maintained Mileage By System

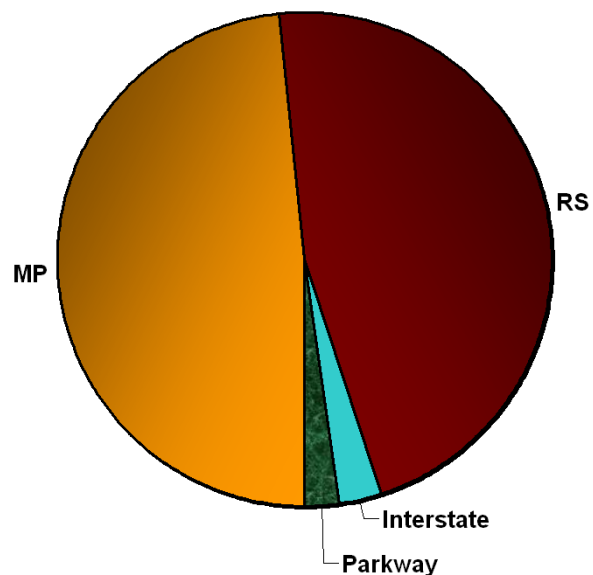

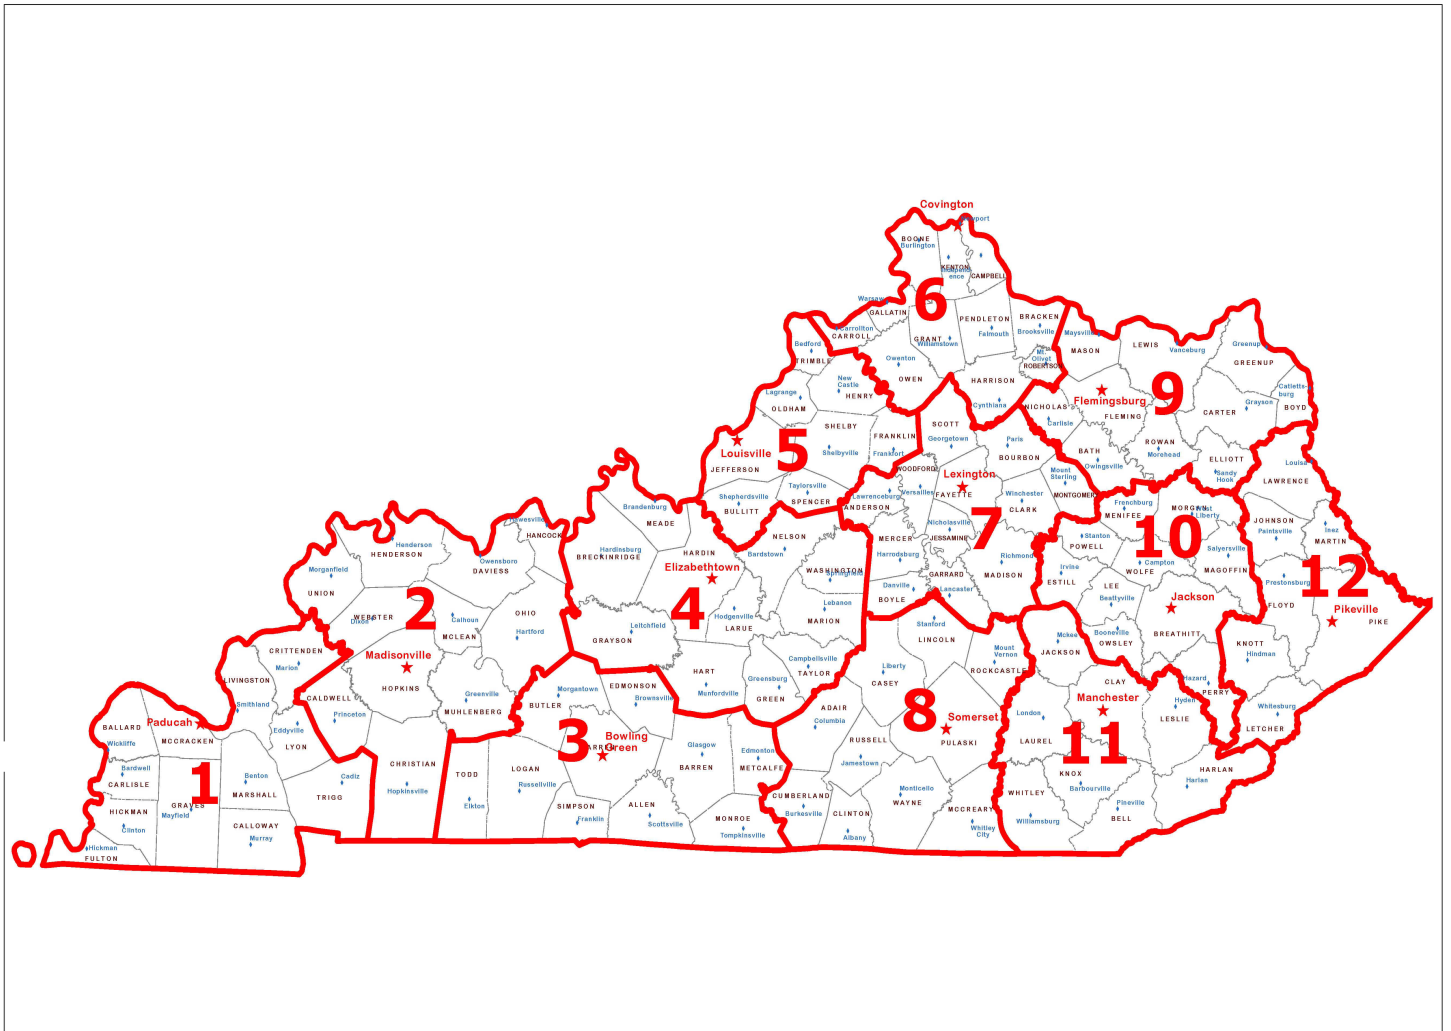

Figure 2: Map of Kentucky's Highway Districts

CHANGES IN THIS REPORT

In 2007, the Kentucky Transportation Cabinet completed its transition from a mainframe Pavement Management System to an Oracle based system which utilizes a more user-friendly interface. In the coming months, access to data used in this report will be available to pavement managers across the state, rather than being limited to Central Office staff. With the upgrade to this new system certain data is now calculated more accurately than was possible with the previous system. Beginning with the 2006 edition of this report, some historical data – particularly IRI and pavement age – does not match previous versions.

MEASURING PAVEMENT SMOOTHNESS

The ride quality of a pavement is generally considered to be a good indicator of the overall condition of the pavement. In Kentucky, the index used to quantify ride quality is the International Roughness Index (IRI). IRI is determined by using truck-mounted inertial profilers which measure the simulated vehicle response to deviations of a pavement from a true planer surface. These simulated responses are summed over the evaluation segment and then divided by the distance traveled to obtain the IRI – which is reported in inches per mile (in/mi). Lower IRI values are indicative of a smooth riding quality, while higher values indicate a rough road.

Technically speaking, there is no limit to how rough a road can be. Consequently, the IRI scale has no upper bound. However, nearly all pavement sections in Kentucky have IRI values between 30 and 250. **Table A** provides a general guide to the conditions a driver could expect for various IRI values.

Table A: Driver Experience for Various IRI Values

IRI Value	IRI Rating	Driver Experience
0 - 50	Very Good	Typical driver will notice no surface irregularities or discomfort in regard to ride quality.
50 - 95	Good	Some surface irregularities may be noticed, but will have no significant impact on driver comfort.
95 - 120	Fair	Noticeable increase in number or severity of irregularities. Driver comfort is moderately impacted if driving for extended periods of times.
120 - 170	Poor	Surface irregularities become frequent, with many being severe in nature. Driver comfort is impacted even during trips of short duration.
170 +	Very Poor	Nearly constant exposure to severe surface irregularities. An immediate impact on driver comfort will be noticed. Typical driver will reduce speed in response.

Because IRI results are both objective and repeatable, it is a very useful tool for comparing conditions of pavements. However, when prioritizing pavement improvement projects, the volume of traffic using a particular road must also be considered. In order to provide the best value to the traveling public, roads with higher traffic volumes should be maintained at a higher level of service than those with low traffic volumes. This is discussed in more detail in the following section.

PAVEMENT CONDITION INDEX (PCI)

The number of cars traveling across a given segment of road is a major consideration in determining highway maintenance priorities. A route with an Average Daily Traffic (ADT) of 15,000 vehicles will impact more people in a single week than a route with 250 vehicles per day will in an entire year. As such, the higher volume route must be given more consideration than the lower volume route.

In order to define the desired levels of IRI for different traffic volumes, the Pavement Condition Index (PCI) was devised. In contrast to the IRI Ratings outlined previously, PCI describes pavements as Good, Fair, or Poor based on a combination of condition (IRI) and traffic volume (ADT).

In order to determine PCI, critical ride values were established for various traffic volumes. Pavements which are rougher than the critical value for the corresponding traffic volume are considered to be in poor condition. **Table B** shows the IRI levels associated with various traffic volumes in poor, fair, and good condition.

Using this table, we can see that a route with an ADT of 15,000 vehicles per day and an IRI of 123 inches per mile would be considered to be in Poor condition. A road with the same roughness (IRI = 123) but with an ADT of 750 vehicles per day would be considered to be in Good condition. Again, this is due to the requirement that high volume routes should be kept in better condition than low volume routes.

Keep in mind that PCI only considers rideability and traffic volume. There are often instances where a pavement will exhibit deterioration that is not reflected in its IRI score. For this reason, visual evaluations conducted by trained engineers are also used to determine pavement condition. If a pavement has been evaluated and it is determined that resurfacing is needed immediately (within one year), the pavement condition is considered to be poor, regardless of the condition indicated in **Table B**.

**Table B: Pavement Condition Based On International
Roughness Index (IRI)**

Average Daily Traffic	Poor Condition	Fair Condition	Good Condition
Above 12,000	121 or higher	96 to 120	95 or lower
10,001 - 12,000	127 or higher	102 to 126	101 or lower
8001 - 10,000	133 or higher	102 to 132	101 or lower
6001 - 8000	140 or higher	109 to 139	108 or lower
4001 - 6000	146 or higher	109 to 145	108 or lower
2001 - 4000	152 or higher	115 to 151	114 or lower
1501 - 2000	159 or higher	115 to 158	114 or lower
1001 - 1500	165 or higher	121 to 164	120 or lower
801 - 1000	172 or higher	121 to 171	120 or lower
601 - 800	178 or higher	128 to 177	127 or lower
401 - 600	184 or higher	128 to 183	127 or lower
201 - 400	191 or higher	134 to 190	133 or lower
1 - 200	198 or higher	134 to 197	133 or lower

When referring to pavement condition throughout this report, “good” pavements consist of those pavements meeting the good condition IRI values indicated above. “Fair” pavements are those that fall within the fair condition values AND do not require resurfacing within one year. “Poor” pavements are those that have IRI values exceeding the poor condition values indicated OR will require resurfacing within one year.

Due to their similar terminology, it is easy to confuse IRI and PCI ratings. To clarify – IRI ratings represent pavement smoothness as it would be experienced by an individual driver. For an individual driver, a pavement is either smooth, rough, or somewhere in between, and does not depend on how many other cars are on the road. On the other hand, PCI ratings represent the condition of the road from the perspective of the pavement manager and will vary depending on the volume of traffic.

MP SYSTEM

CURRENT RIDE QUALITY CONDITIONS

In 2007, the average statewide IRI for all MP roads was 112. This represents a slight increase in roughness from the 2006 value of 110. **Figure 3** illustrates the changing ride quality of MP routes since 1988.

Figure 3: Average Statewide Roughness for MP Roads Since 1988

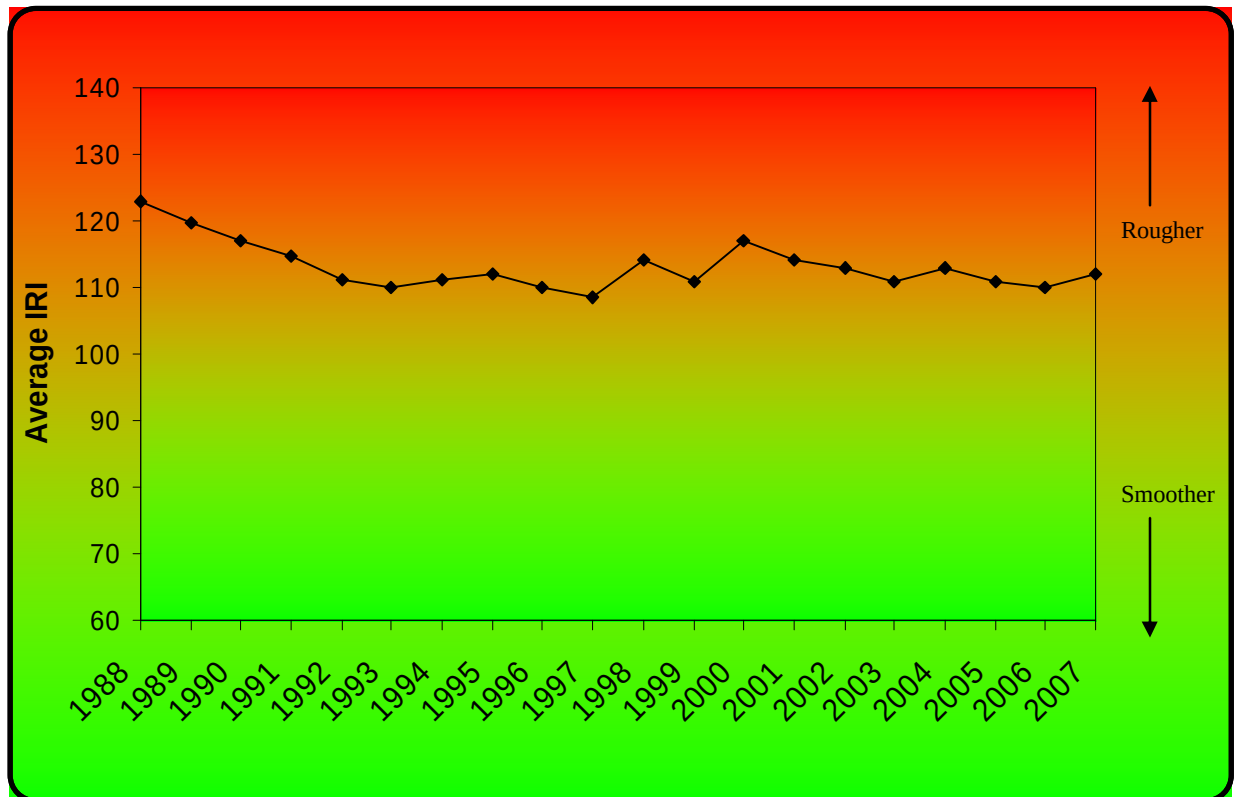

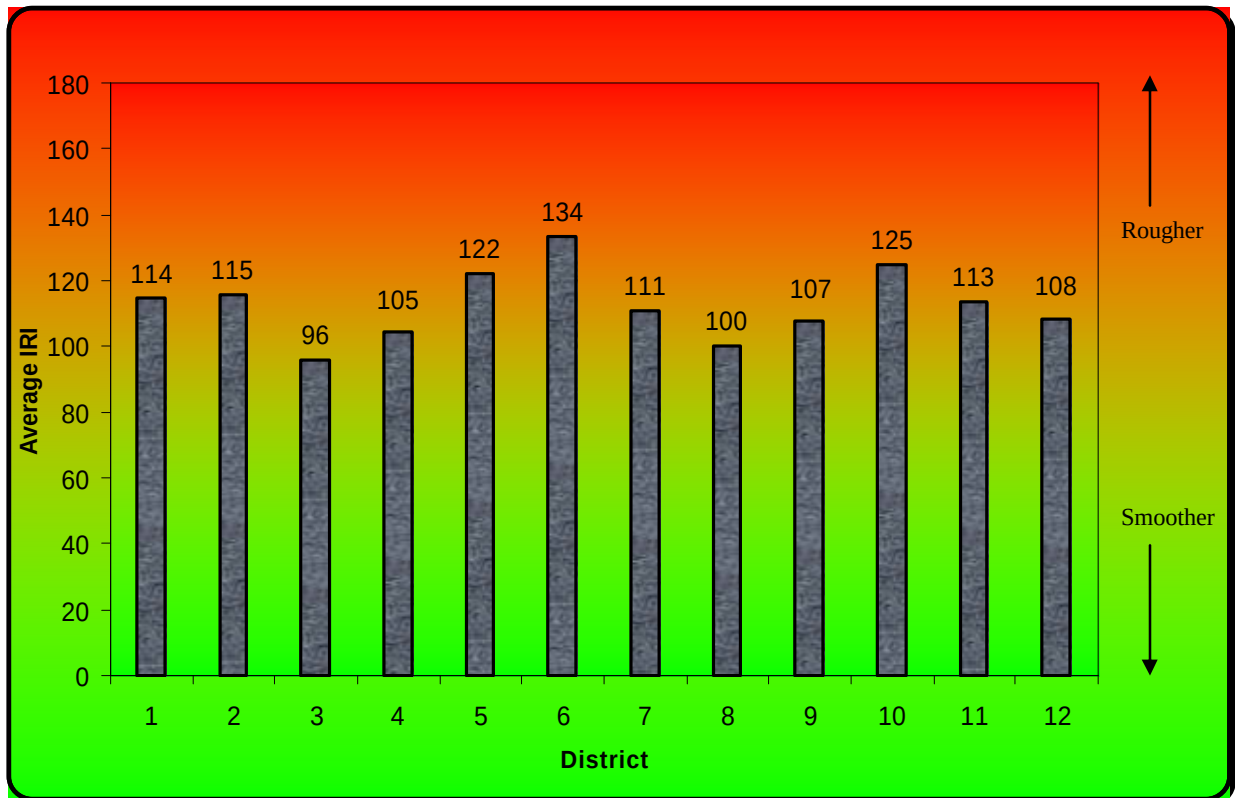

Figure 4 shows the current average IRI for each district. These average values are weighted according to vehicle miles traveled on each pavement section. Consequently, they represent the ride quality that the average driver could expect within each district. Districts 6, 10, and 5 had the roughest pavements with average IRI values of 134, 125, and 122, respectively. Districts 3 and 8 had the smoothest pavements with average IRI values of 96 and 100.

Because these are average values rather than values for individual roads, the IRI ratings discussed previously cannot be applied here. When comparing two routes, an IRI difference of 5 to 10 points is relatively insignificant. However, when looking at the average rideability over an

entire district, a 5 to 10 point difference is substantial. Consequently, the 134 IRI value for District 6 represents an average pavement condition for MP routes that is considerably worse than any other district.

Figure 4: Average IRI on MP Roads Based on Vehicle Miles Traveled

MP CONDITION TRENDS

Generally, Pavement Condition is closely tied to rideability. However, during recent years, the overall condition of MP roads has deteriorated in spite of decreases in average roughness. This is likely due to an increase in surface distresses that do not impact rideability. Examples include centerline joint separation, raveling, and rutting.

The changing percentage of good, fair, and poor condition pavements is illustrated in **Figure 5**. Precise values for each condition, as well as additional information regarding mileage, average pavement age, and traffic levels are shown in **Table C**.

Figure 5: Percentage of Good, Fair, and Poor MP Pavements Since 1988

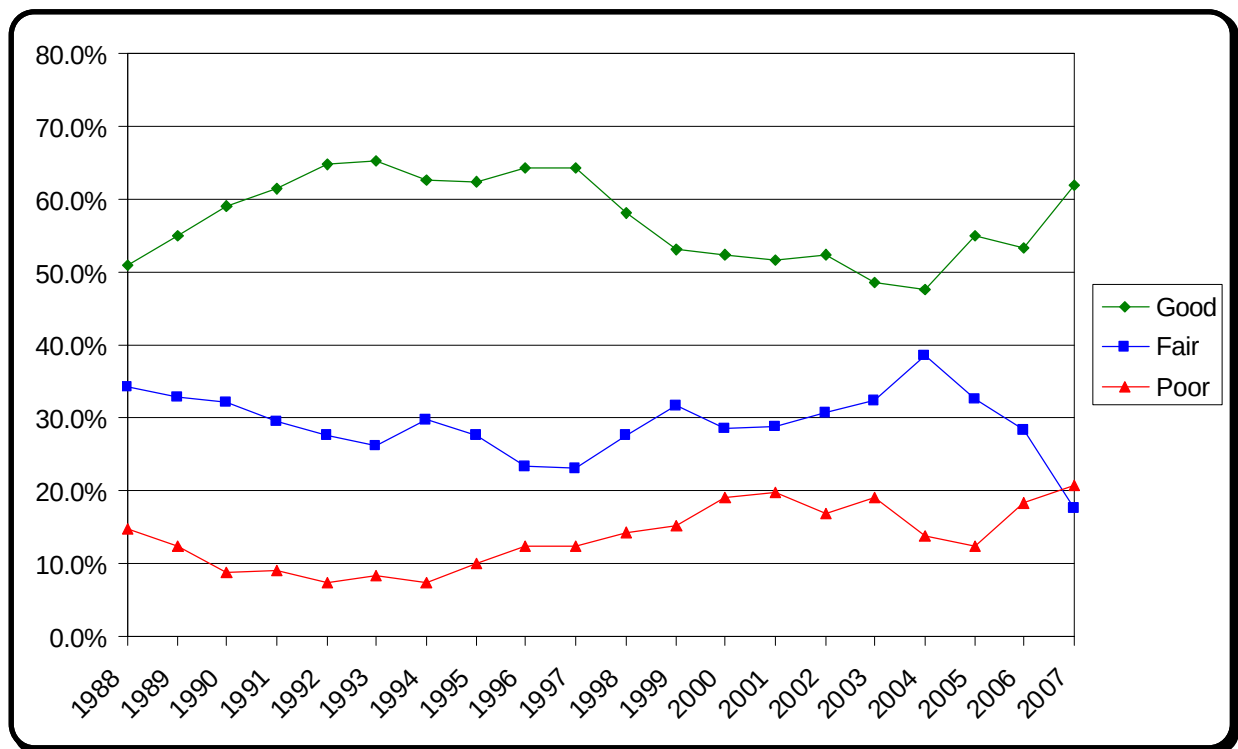

Table C: Condition of MP System Highways

Year	Total Mileage	IRI	AGE (Years)*	ADT	Good	Fair	Poor
1988	13,538	123		3250	51%	34%	15%
1989	13,808	120		3330	55%	33%	12%
1990	13,809	117		3410	59%	32%	9%
1991	13,809	115		3530	61%	30%	9%
1992	13,809	111		3620	65%	28%	8%
1993	13,809	110		3710	65%	26%	8%
1994	13,809	111		3770	63%	30%	8%
1995	13,809	112	9.1	3880	63%	28%	10%
1996	13,809	110	9.3	3970	64%	23%	12%
1997	13,809	108	9.2	4060	64%	23%	12%
1998	13,823	111	9.0	4160	58%	28%	14%
1999	14,019	111	8.9	4270	53%	32%	15%
2000	14,015	117	8.8	4360	52%	29%	19%
2001	14,036	114	8.5	4440	52%	29%	20%
2002	14,033	113	8.5	4400	52%	31%	17%
2003	14,030	111	8.6	4400	49%	33%	19%
2004	14,032	113	9.3	4557	48%	39%	14%
2005	14,052	111	8.8	4482	55%	33%	12%
2006	13,395	110	9.1	4747	53%	28%	18%
2007	13,281	112	8.9	4709	62%	18%	21%

* Average Pavement Age not currently available prior to 1995.

Between 1988 and 1993, the percentage of MP pavements in good condition increased from 51% to 65%, while poor pavements dropped to 8%. This level of performance was sustained until 1998, when the percentage of good pavements began to drop significantly, reaching a low point of 48% in 2004.

Since that time, an unusual trend has developed - the percentage of good and poor pavements have increased in concert with each other. Between 2004 and 2007, the percentage of good pavements increased from 48% to 62%. At the same time, the percentage of poor pavements increased from 14% to 21% - the highest percentage recorded thus far. This is the first time since PCI has been tracked that good and poor pavements have both risen significantly over any three-year period.

Normally, increases in good pavement condition are met with decreases in the percentage of pavements in poor condition. The precise cause of this “good/poor” increase is not immediately apparent, but could be attributed to two possible issues:

First, the pavements in fair condition may have experienced a higher than normal rate of deterioration. This would result in an increased movement of pavements from the fair category to poor. In this case, the increased number of poor pavements could have outpaced the rate at which the resurfacing program could convert them to good pavements.

A second cause for the “good/poor” increase may lie in the pavement management strategy that was employed during this period. Until very recently, management of asphalt pavements in Kentucky relied solely on an approach of resurfacing those roads that were in the worst condition. Because funding is limited, and resurfacing costs are volatile, this strategy limits the number of roads that can be treated. Further exacerbating this problem is the fact that resurfacing has occasionally been applied to roads that could have been improved with a less intensive treatment. Resurfacing roads in fair condition leads to an increase in good roads without a corresponding drop in poor roads.

Regardless of which of these two scenarios is responsible for the current trend, they can both be addressed with the same approach. Resurfacing and rehabilitation of pavements should be reserved for those pavements in the poorest condition, while preventive maintenance treatments should be applied to roads in relatively good condition in order to prolong their service life. Applying this strategy will reduce the overall percentage of poor pavements on the MP system.

Preventive maintenance strategies require that short-term, low-cost treatments be applied to roads that are still in fair condition. Treatments such as crack-sealing, fog sealing, and ultrathin asphalt overlays can slow the deterioration of fair pavements into the poor category – and will sometimes result in an improved roadway condition – but only if they are applied early on in the life of the pavement. Conversely, resurfacing will significantly improve the condition of a road, but should always be limited to those pavements that are already in poor condition.

RS SYSTEM

CURRENT RIDE QUALITY CONDITIONS

The average statewide IRI in 2007 for RS roads was 130. This is essentially unchanged from the 2006 IRI of 129, but represents a significantly rougher condition than was achieved in 1997, when the IRI for RS roads reached a low of 120. **Figure 7** shows the changing ride quality of RS routes since 1988.

Figure 7: Average Statewide Roughness for RS Roads Since 1988

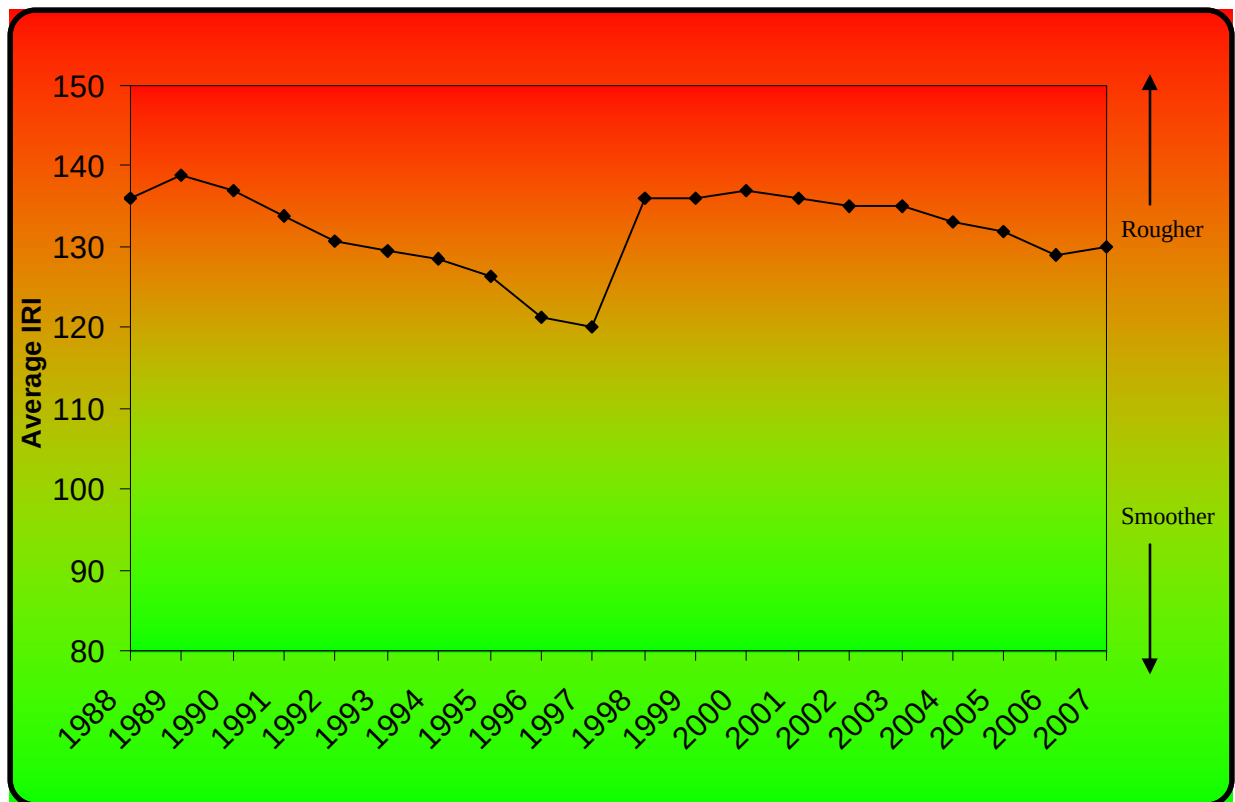

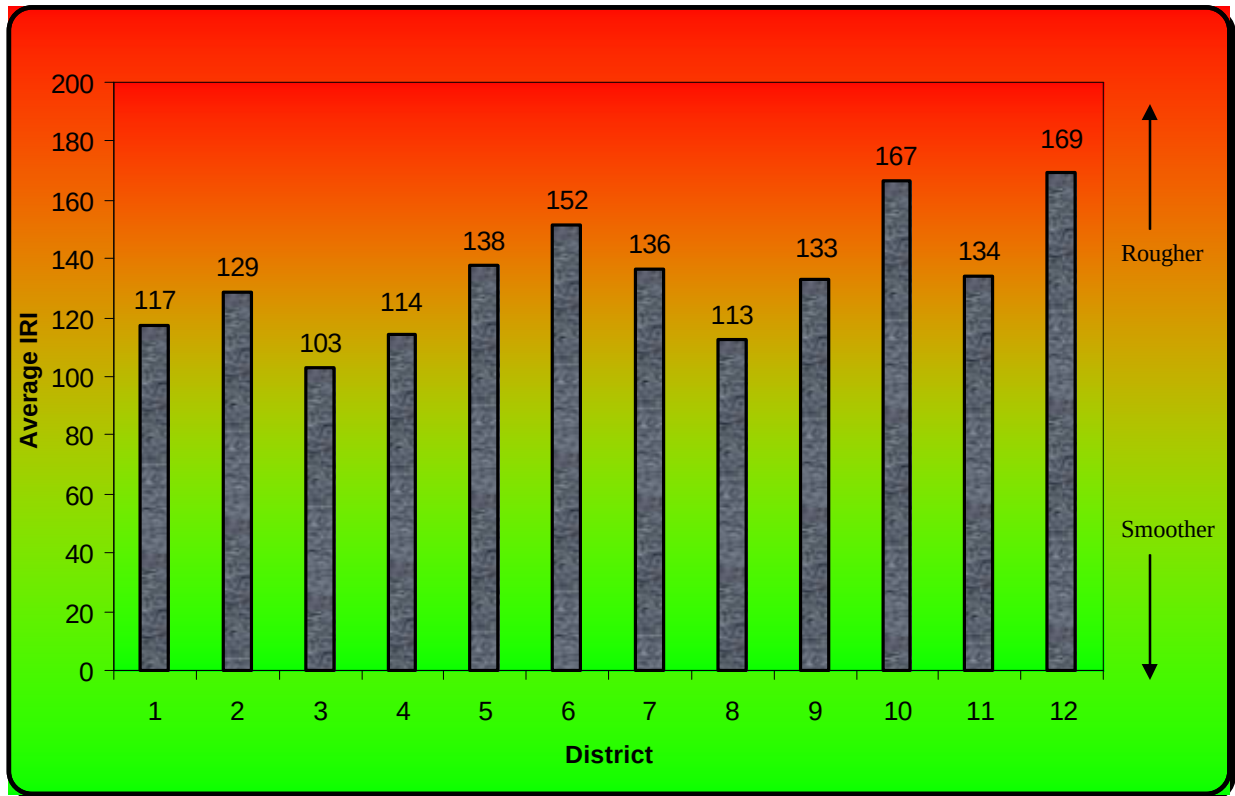

Figure 8 on the following page shows the average IRI for RS roads within each district. As was the case with MP roads, the smoothest RS pavements can be found in Districts 3 and 8, with average IRI values of 103 and 113 respectively. The roughest RS roads were in District 12 (IRI = 169), District 10 (167), and District 6 (152).

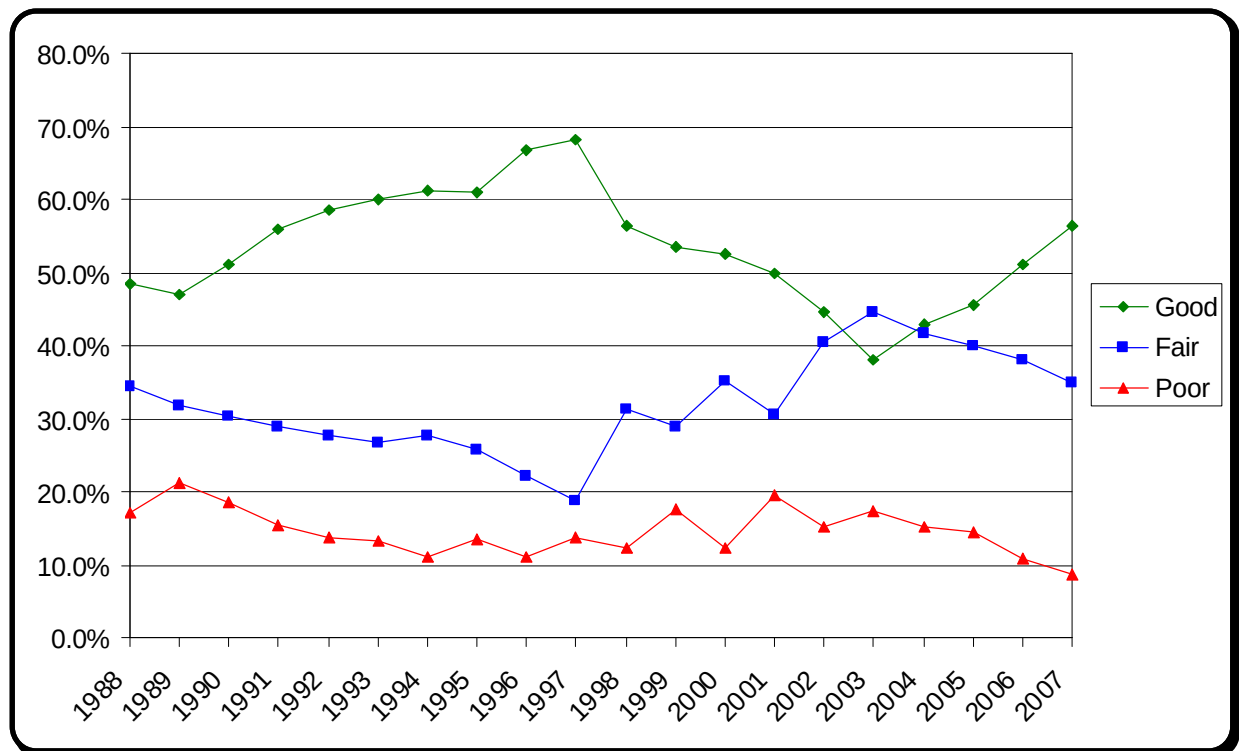

Figure 8: Average IRI on RS Roads Based on Vehicle Miles Traveled

RS CONDITION TRENDS

As stated previously, the overall condition of pavements is closely related to IRI. As such, the percentage of poor pavements on RS roads has fallen in recent years in conjunction with decreases in average IRI. **Figure 9** shows the percentage of good, fair, and poor RS pavements since 1988. **Table D** shows exact values for each condition, as well as additional information regarding mileage, age, and ADT.

Figure 9: Percentage of Good, Fair, and Poor RS Pavements Since 1988

Between 1988 and 1997, there was a steady increase in good pavements on the RS system. During the same time, fair and poor pavements dropped steadily.

Beginning in 1997, the percentage of good pavements dropped dramatically until 2003, falling from a high of 68% down to a low of 38% during this time. Fair pavements increased during this period from 19% to 47%, while poor pavements remained relatively flat. In 2003 fair pavements outnumbered good pavements on the RS system for the first time. Since that time, an aggressive resurfacing program has improved the percentage of good pavements to 56% in 2007, while poor pavements have reached an all-time low of 9%.

TABLE D: Condition of RS System Highways

Year	Total Mileage	IRI	AGE (Years)*	ADT	Good	Fair	Poor
1988	12,152	136		610	49%	35%	17%
1989	12,153	139		610	47%	32%	21%
1990	12,153	137		650	51%	30%	19%
1991	12,152	134		670	56%	29%	15%
1992	12,152	131		690	59%	28%	14%
1993	12,153	130		710	60%	27%	13%
1994	12,153	129		730	61%	28%	11%
1995	12,153	126	12.2	750	61%	26%	13%
1996	12,153	122	11.4	770	67%	22%	11%
1997	12,153	120	11.0	770	68%	19%	14%
1998	12,153	136	11.0	790	56%	31%	12%
1999	12,156	136	10.4	800	54%	29%	18%
2000	12,166	137	10.1	820	53%	35%	12%
2001	12,163	136	9.5	810	50%	31%	20%
2002	12,132	135	9.2	790	45%	40%	15%
2003	12,134	135	9.4	780	38%	45%	17%
2004	12,994	133	9.7	706	43%	42%	15%
2005	12,965	132	9.8	718	46%	40%	14%
2006	12,982	129	9.6	739	51%	38%	11%
2007	12,822	130	9.7	732	56%	35%	9%

* Average Pavement Age not currently available prior to 1995.

RESURFACING NEEDS AND FUNDING

As pavements age, they undergo a natural deterioration of conditions that is reflected both in surface distresses (cracking, loss of material, etc.) and in the roughness of the road. Even roads with light traffic will experience this deterioration due to the effects of weathering and oxidation of asphalt in the pavement.

Past efforts in Kentucky to improve conditions focused almost exclusively on reducing the percentage of poor pavements by resurfacing them in a manner which addressed the most severely deteriorated pavements first. This “worst-first” approach worked to address overall system condition by moving pavements from a poor rating to a good rating. In order to realize an overall improvement in system condition, pavements had to be moved from the poor category and into the good category at a rate which was faster than the natural deterioration of pavements moving from fair to poor.

RESURFACING CYCLE LENGTH

When employing the “worst-first” strategy, the future condition of the system can generally be predicted based on the resurfacing cycle length – the number of years required to resurface the entire system. The resurfacing cycle is determined each year by dividing the total system length by the number of miles resurfaced. In 2007, 747 of 13,229 MP miles were resurfaced, and 788 of 12,826 RS miles were resurfaced. At this rate, it would require 17.7 years to resurface the entire MP system, and 16.3 years to resurface the entire RS system.

Past experience in Kentucky indicates that using the “worst-first” approach requires an average resurfacing cycle of 13-14 years in order to maintain MP pavements in their current condition. In order to realize improvements, a cycle length of less than 13 years is required. The resurfacing cycle, cost per mile, and overall MP resurfacing budget for each year since 1978 are provided in **Table E**.

During the six years from 1987 through 1992, the Department of Highways resurfaced MP pavements on a 12-14 year cycle. Rideability of the MP system improved each of those years, and conditions among the highway districts became more equalized. Additionally, the mileage of pavements in poor condition decreased by almost 50% during the same period.

Between 1993 and 1999, the resurfacing cycle was greater than 15 years due to significant increases in MP resurfacing costs. During this period, the previous reduction in poor pavement mileage was wiped out entirely, with poor pavements once again representing over 15% of the MP system. While the cycle length did drop down to 14.4 and 14.0 in 2000 and 2001, this was not enough to offset the residual effects of the preceding years. Poor pavements continued to increase to a high of 20% in 2001.

Table E: Annual MP Resurfacing Program

Year	Miles Resurfaced	Resurfacing Cycle (Years)	Resurfacing Budget (Millions)	Average Cost Per Mile
1978	877	15.0	24.4	\$ 27,800
1979	633	20.8	19.6	\$ 31,000
1980	584	22.6	21.3	\$ 36,500
1981	1100	12.0	39.0	\$ 35,500
1982	843	15.6	27.3	\$ 32,400
1983	721	18.3	24.0	\$ 33,300
1984	573	23.0	19.7	\$ 34,400
1985	326	40.5	12.8	\$ 39,300
1986	896	14.7	35.0	\$ 39,100
1987	978	13.4	34.1	\$ 34,800
1988	957	13.7	32.4	\$ 33,900
1989	886	14.5	33.4	\$ 37,700
1990	1064	12.4	40.7	\$ 38,300
1991	982	13.5	43.0	\$ 43,800
1992	1017	13.0	44.0	\$ 43,200
1993	802	16.4	39.6	\$ 49,300
1994	836	15.8	39.1	\$ 46,800
1995	840	16.4	45.7	\$ 54,400
1996	590	22.6	32.3	\$ 54,700
1997	857	15.6	50.6	\$ 59,100
1998	912	15.1	62.0	\$ 68,000
1999	839	16.3	61.7	\$ 73,500
2000	970	14.4	61.1	\$ 63,000
2001	1001	14.0	63.7	\$ 63,600
2002	857	16.3	62.5	\$ 72,900
2003	911	14.5	67.1	\$ 73,900
2004	884	15.0	66.8	\$ 75,600
2005	1019	13.0	88.9	\$ 87,200
2006	612	21.7	62.6	\$ 102,300
2007	747	17.7	83.5	\$ 111,800

Relatively steady costs, coupled with a significant increase in resurfacing funds during 2005 allowed for slight reductions in poor pavements during the period of 2002 – 2005. However, these gains were once again lost when dramatic increases in the price of oil during 2006 caused the average cost of resurfacing to increase from \$87,200 per mile to \$102,300 per mile. In 2007, this cost increased even further to \$111,800 per mile.

Due to their lower traffic volumes, RS roads do not deteriorate at the same rate as MP routes. As such, maintaining a consistent condition across the RS system only requires a resurfacing cycle of 15 to 16 years. **Table F** on the following page shows the miles resurfaced, resurfacing cycle, total budget, and average cost per mile for the RS resurfacing program since 1979.

The RS system resurfacing cycle length has varied significantly over the years, ranging from a high of 84.1 years in 1984 when only 113 miles were resurfaced, to a low of 8.0 years in 1995 when over 1500 miles were resurfaced. Because of these wide variations, it is more difficult to pinpoint trends in condition than with the MP system. However, some conclusions can be determined from the data based on average cycle length over a period of time.

Between 1979 and 1988, the average RS resurfacing cycle length was 33 years. During that time, the percentage of good pavements fell to below 50%, while poor pavements rose to above 20%. Following this period, the resurfacing cycle length averaged 14.8 years until 1996. Accordingly, good pavements increased to nearly 70% of the RS system, while poor pavements dropped to 10%. Unfortunately, this trend was reversed between 1996 and 2003, when the resurfacing cycle length increased back to 16.3 years and good pavements dropped down to below 40% of the total RS system.

Since 2003, the RS resurfacing cycle length has averaged 13.7 years. This is better than the 15 to 16 year cycle lengths required to maintain constant conditions on RS roads. Consequently, the percentage of good pavements has increased from 38.1 in 2003 to 56% in 2007. Furthermore, the percentage of RS pavements in poor condition has decreased over this period from 17% to 9%.

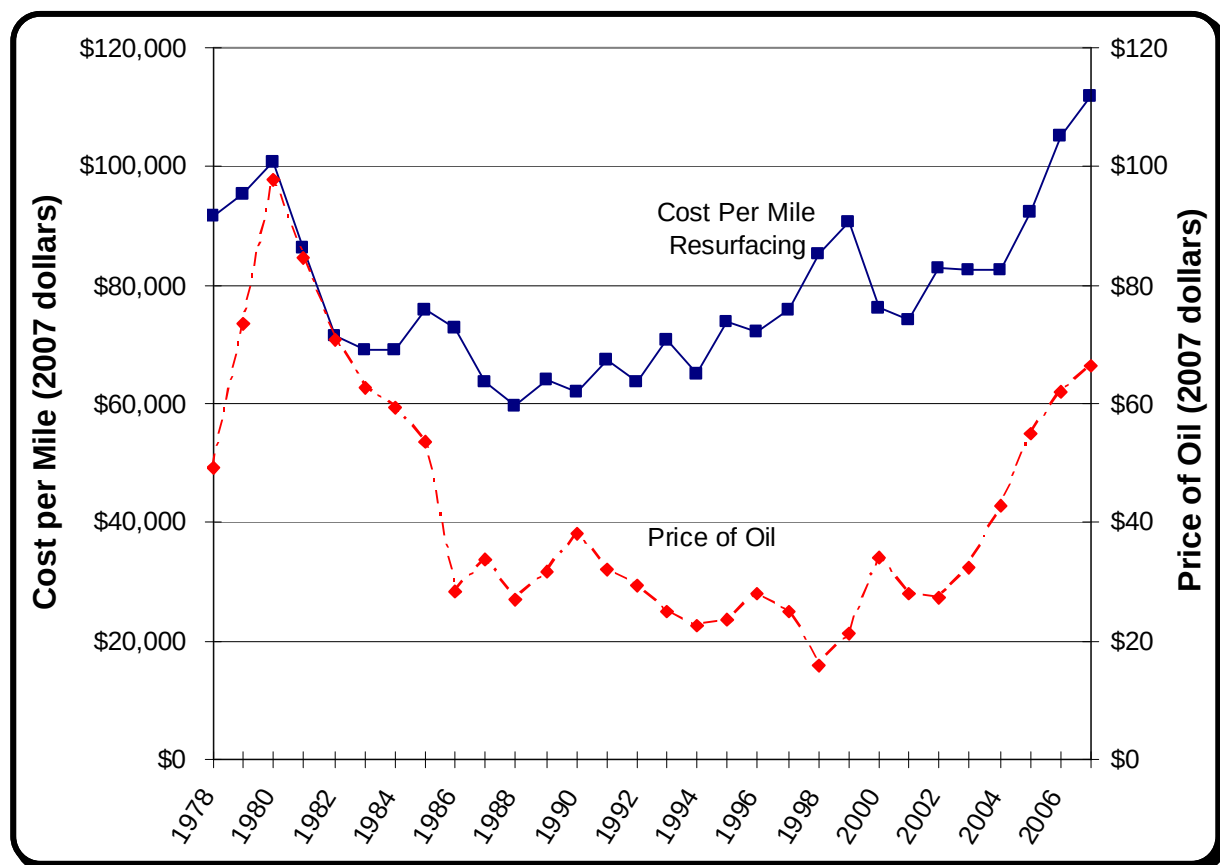

Table F: Annual RS Resurfacing Program

Year	Miles Resurfaced	Resurfacing Cycle (Years)	Cost (Millions)	Average Cost Per Mile
1979	532	17.9	14.1	\$ 26,500
1980	221	43.0	7.0	\$ 31,700
1981	261	36.4	8.1	\$ 31,000

2007	788	16.3	45.7	\$ 58,000

FUTURE COST TRENDS

The correlation between increasing oil prices and resurfacing costs threatens to have a long-term impact on the condition of pavements in Kentucky. **Figure 10** shows this correlation since 1978 with costs adjusted for inflation and expressed in 2007 dollars. From the graph, we can see that increases in the cost of oil have generally been followed by increases in the cost of resurfacing. Unfortunately, the reverse has not always been true. Since 1982, decreases in the cost of oil have generally resulted in little or no reduction in resurfacing costs.

Figure 10: MP Resurfacing Costs vs. Price of Oil

Source: www.inflationdata.com/inflation/Inflation_Rate/Historical_Oil_Prices_Chart.asp

As a consequence, the most optimistic forecasting of future resurfacing costs would indicate that costs will remain at least as high as they currently are, even if oil prices drop. More likely, costs will continue to escalate as increasing demand for oil drives prices up further. Over the past three years, resurfacing costs have increased at an average rate of 10% annually. At this rate, 2008 costs are estimated to be \$123,000 per mile. With almost 13,000 miles of asphalt pavements on the MP system, Kentucky is particularly vulnerable to these price increases.

If the “worst-first” strategy continues to be the primary method for addressing MP pavement needs, the resurfacing budget must be increased from \$83.5 million to at least \$116 million simply to maintain current conditions. This would represent an increase of almost 40%, and does not take into consideration any possible future increases in cost. If costs continue to go up at an average rate of 10% annually, the required funding to maintain current conditions will increase to \$154 million within three years. In order to realize improvements on the MP System, even higher budget amounts will be necessary using this strategy. Budget needs for various resurfacing cycle lengths were calculated using the most recent cost data available and are indicated in **Table G**.

Table G: Budget Needs for Various MP Resurfacing Cycle Lengths

Desired Cycle (years)	Miles Per Year	Cost Per Year*
12	1102	\$ 135,500,000
13	1018	\$ 125,000,000
14	945	\$ 116,000,000
15	882	\$ 108,000,000
16	827	\$ 102,000,000

* Using estimated 2008 Cost of \$123,000 per mile

The projected MP resurfacing cycle length using the current funding level of \$83.5 million is almost 18 years. Resurfacing cycles of this length will result in immediate increases in the number of poor pavements unless a change in strategy is implemented.

Resurfacing costs on the RS system have also undergone significant increases in recent years. During 2006, costs rose dramatically from \$45,700 per mile to \$67,000 per mile. However, costs dropped in 2007 to \$58,000 per mile. Over the past three years, this represents a 12% annual increase. At this rate, 2008 costs are estimated to be \$65,000 per mile. Using this value, budget needs for various resurfacing cycle lengths were also calculated for the RS system and are shown in **Table H**.

Table H: Budget Needs for Various RS Resurfacing Cycle Lengths

Desired Cycle (years)	Miles Per Year	Cost Per Year*
13	987	64,000,000
14	916	59,500,000
15	855	55,500,000
16	802	52,000,000
17	754	49,000,000

* Using estimated 2008 Cost of \$65,000 per mile

SAVINGS OPPORTUNITIES – AN ALTERNATIVE TO “WORST-FIRST”

Kentucky’s highway system is quickly approaching a critical turning point. With historical data as a guide, there are three options available to the Department of Highways:

1. **Maintain Current Strategy and Condition** – Using the current “worst-first” strategy, additional funding of 40% to 80% will be required over the next three years in order to maintain pavements in their current condition.
2. **Maintain Current Strategy and Spending Levels** – If the “worst-first” strategy is maintained at current spending levels, pavement conditions will deteriorate significantly, with 30% to 40% of pavements falling into poor condition within the next three years.
3. **Alter Current Strategy and Spending Levels** – If a sufficient investment in preventive maintenance techniques is implemented, resurfacing cycles of 16 – 20 years can be achieved while still maintaining current system conditions. This would still require increases in overall funding of between 20% and 25%. However, if this added funding is not available, implementing such a strategy will still help to slow the rate of deterioration.

Preventive maintenance treatments can improve the overall condition of the highway network by prolonging the period of time in which a pavement is in fair or good condition. This would allow the Cabinet to continue to resurface poor pavements – and thereby reducing their prevalence – while slowing the deterioration of more pavements into the poor category. Over time, this would result in a decrease in the percentage of poor pavements across the system and an overall increase in ride quality.

Preventive maintenance treatments serve to preserve the system, retard future deterioration, extend service life, and maintain or even improve the functional condition of the system, but do not substantially increase structural capacity. Consequently, preventive maintenance treatments should only be applied on pavements without underlying structural problems. Once a pavement begins to exhibit moderate to high levels of deterioration, resurfacing or rehabilitation become the only appropriate options.

Figures 11 and 12 on the following page illustrate the advantages of a preventive maintenance program as opposed to the “worst-first” strategy. In both figures, pavement condition is indicated by the curved line. Improvements are designated by the vertical lines.

Figure 11: Pavement Condition with “Worst-First” Strategy

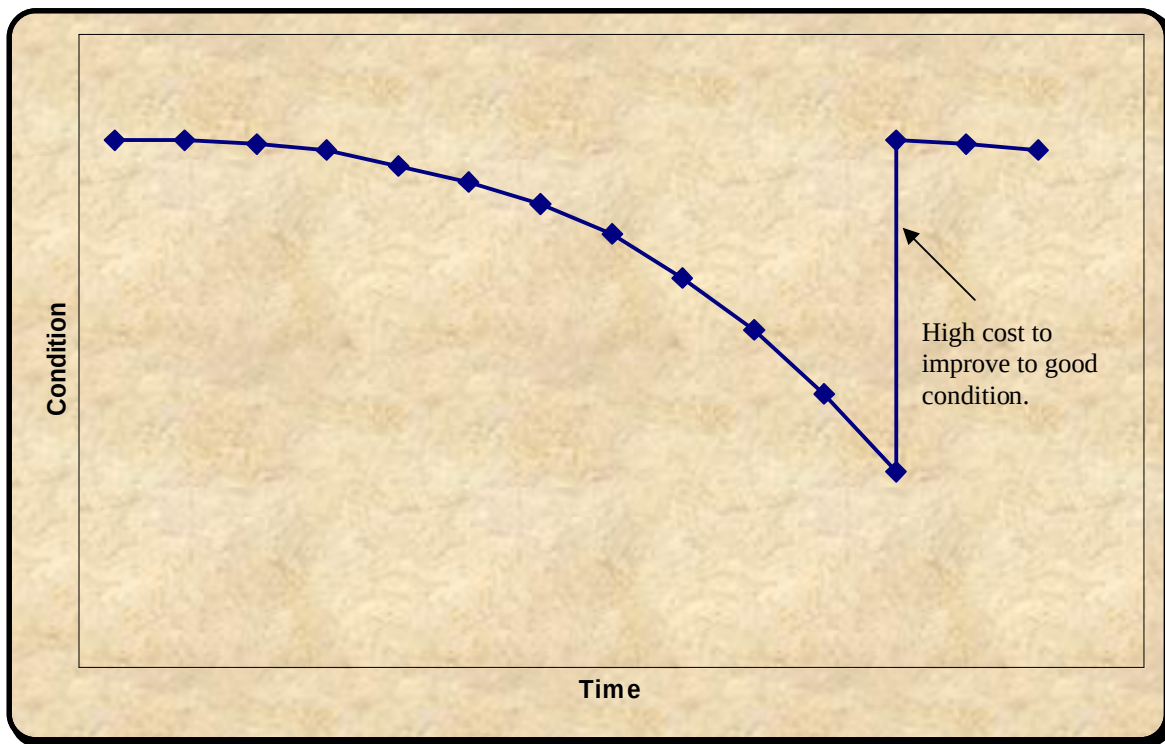

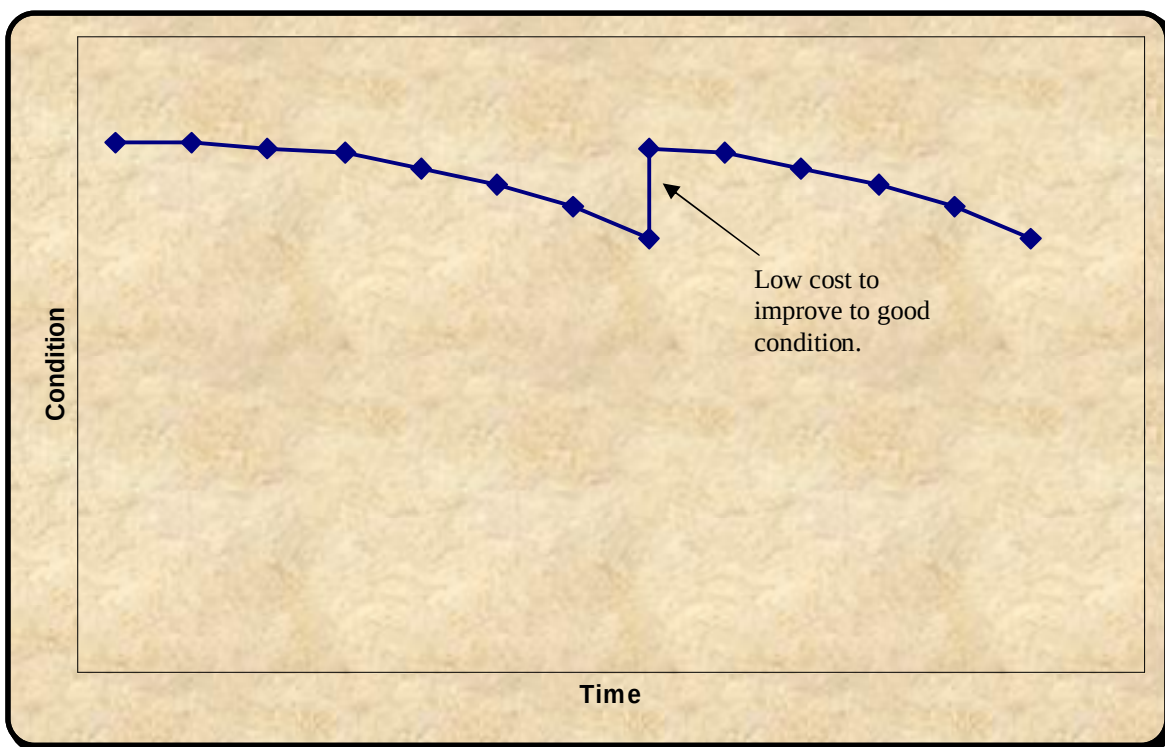

Figure 12: Pavement Condition with Preventive Maintenance Strategy

Typically, pavements experience very little deterioration during the first years after resurfacing, and deteriorate more rapidly as time progresses. When pavements are left unattended until resurfacing is required, the costs of returning them to a fair or good condition are significantly higher. By treating pavements earlier on in their life, it is possible to maintain them in fair to good condition for a longer period of time at lower cost.

It is this lower cost that represents the major benefit of preventive maintenance. Crack sealing, microsurfacing, ultra-thin asphalt overlays, and fog seals can be performed for prices ranging from \$4000 per mile to \$45,000 per mile. This is significantly less than the current resurfacing cost of \$111,800 per mile. However, resurfacing will last for a significantly longer period of time than preventive maintenance treatments. For instance, crack sealing can only be expected to extend the life of a pavement by 2 - 3 years, compared to 12 - 13 years for resurfacing. To accurately compare the two treatments, they must be analyzed in terms of cost per year.

With a cost of \$4,000 per mile and a life extension of 2 years, crack sealing costs \$2,000 per year for each mile treated ($\$4,000 / 2 \text{ years} = \$2,000 \text{ per year}$). Meanwhile, resurfacing costs \$111,800 and will extend a pavement by 12 years, thereby costing \$9,316 per year for each mile treated ($\$111,800 / 12 \text{ years} = \$9,316 \text{ per year}$).

As a result, crack sealing provides a life extension benefit which is 4.6 times greater than resurfacing. However, resurfacing is still an appropriate treatment under many circumstances. Crack sealing and other preventive maintenance treatments can only be performed on pavements in relatively good condition, and will not keep a road in good condition indefinitely. Eventually, other issues will require that resurfacing or rehabilitation be performed. The idea is to lengthen the time that a road can go before these more expensive treatments are required.

A similar analogy can be found in the maintenance that is performed on a car. Oil changes and other regular maintenance will not keep a car running forever – eventually it will have to be replaced. However, by performing periodic maintenance the car can be made to last much longer, thereby saving money in the long term.

With the exception of crack sealing, Kentucky has very little experience with other preventive maintenance treatments, making it difficult to provide exact cost comparisons at this time.

However, many other states have had preventive maintenance programs for several years and their research indicates savings of between \$4 and \$8 for every dollar spent on preventive maintenance. With this in mind, it is recommended that preventive maintenance funding be increased to \$5 million for MP pavements and \$3 million for RS pavements so that conditions can be maintained for longer periods until resurfacing can be performed.

In 2006, Kentucky began to invest a portion of maintenance funding on preventive maintenance treatments. However, a reluctance to accept the preventive maintenance concept and concern for its impact on industry within the state limited the number and type of projects that were employed. The breadth of options available must be expanded and their use must be encouraged in order to see an improvement in conditions.

After experience is gained with preventive maintenance techniques, conditions will improve throughout the state-maintained system. This will be realized by improving those roads in poorest condition through resurfacing and rehabilitation, and by slowing deterioration of roads in fair condition by means of preventive maintenance treatments.

Once progress is made toward reducing the percentage of poor pavements on the MP system, more funds should then be available for capital improvements. Widening projects, safety improvements, and major rehabilitation needs can be more adequately addressed once preservation of the existing system is stabilized.

APPENDIX A

TABULATIONS BY DISTRICT AND YEAR OF PERCENT OF NEW SURFACE, IRI, AGE, ADT AND PERCENT OF PAVEMENTS IN POOR CONDITION

Note: Lack of personnel in Years 1999 and 2001 resulted in only approximately 10% of the RS system being tested. In 2003 approximately 25% of the RS system was tested.
