

APPENDIX

B SAFETY

SAFETY

A historical crash analysis was performed to examine traffic safety trends and to identify potential safety issues within the study area. Five years of crash data (2018 to 2022) obtained from the Kentucky State Police (KSP) database were used in the analysis. It should be noted that the crash data from 2020 (during the COVID-19 pandemic) appeared to have similar crash characteristics as the previous years and was included in the analysis.

Within the five-year analysis period, 1,843 crashes were reported in the study area. Commercial vehicle crashes accounted for 159 (8.6%) of all crashes. Nine pedestrian crashes occurred, including one fatal crash and two serious injuries. Three bicyclist crashes occurred. An overview of the location of these crashes is shown in **Figure 1** and **Figure 2**.

Figure 1: Crash Severity by Location, 2018-2022

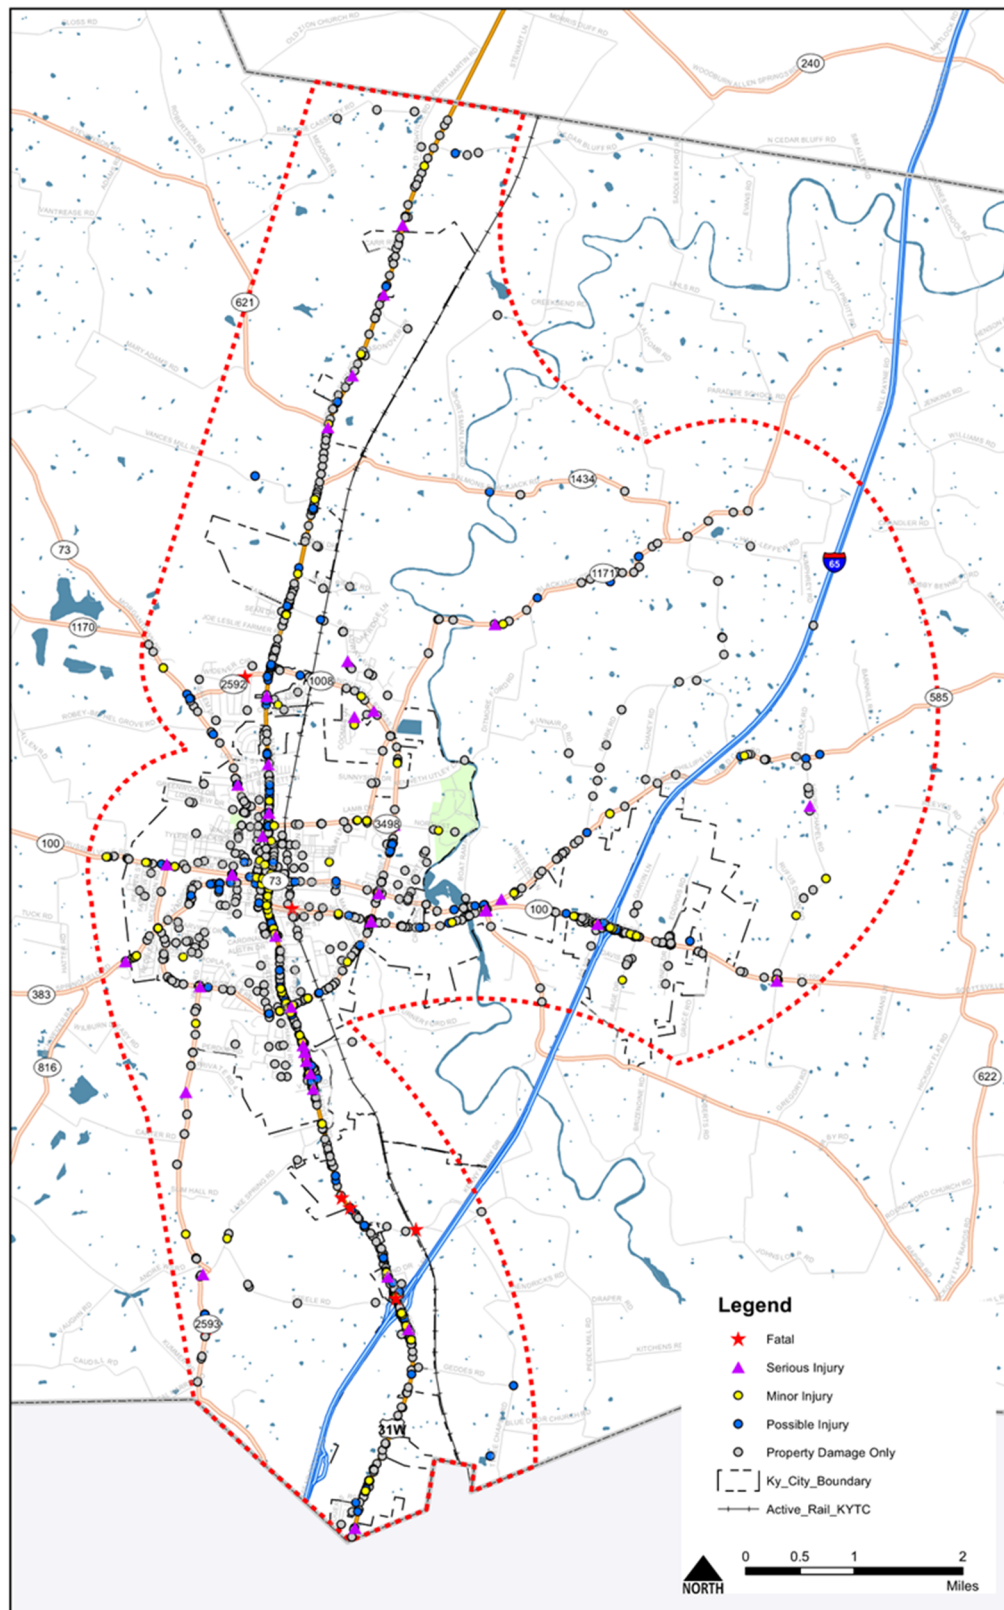

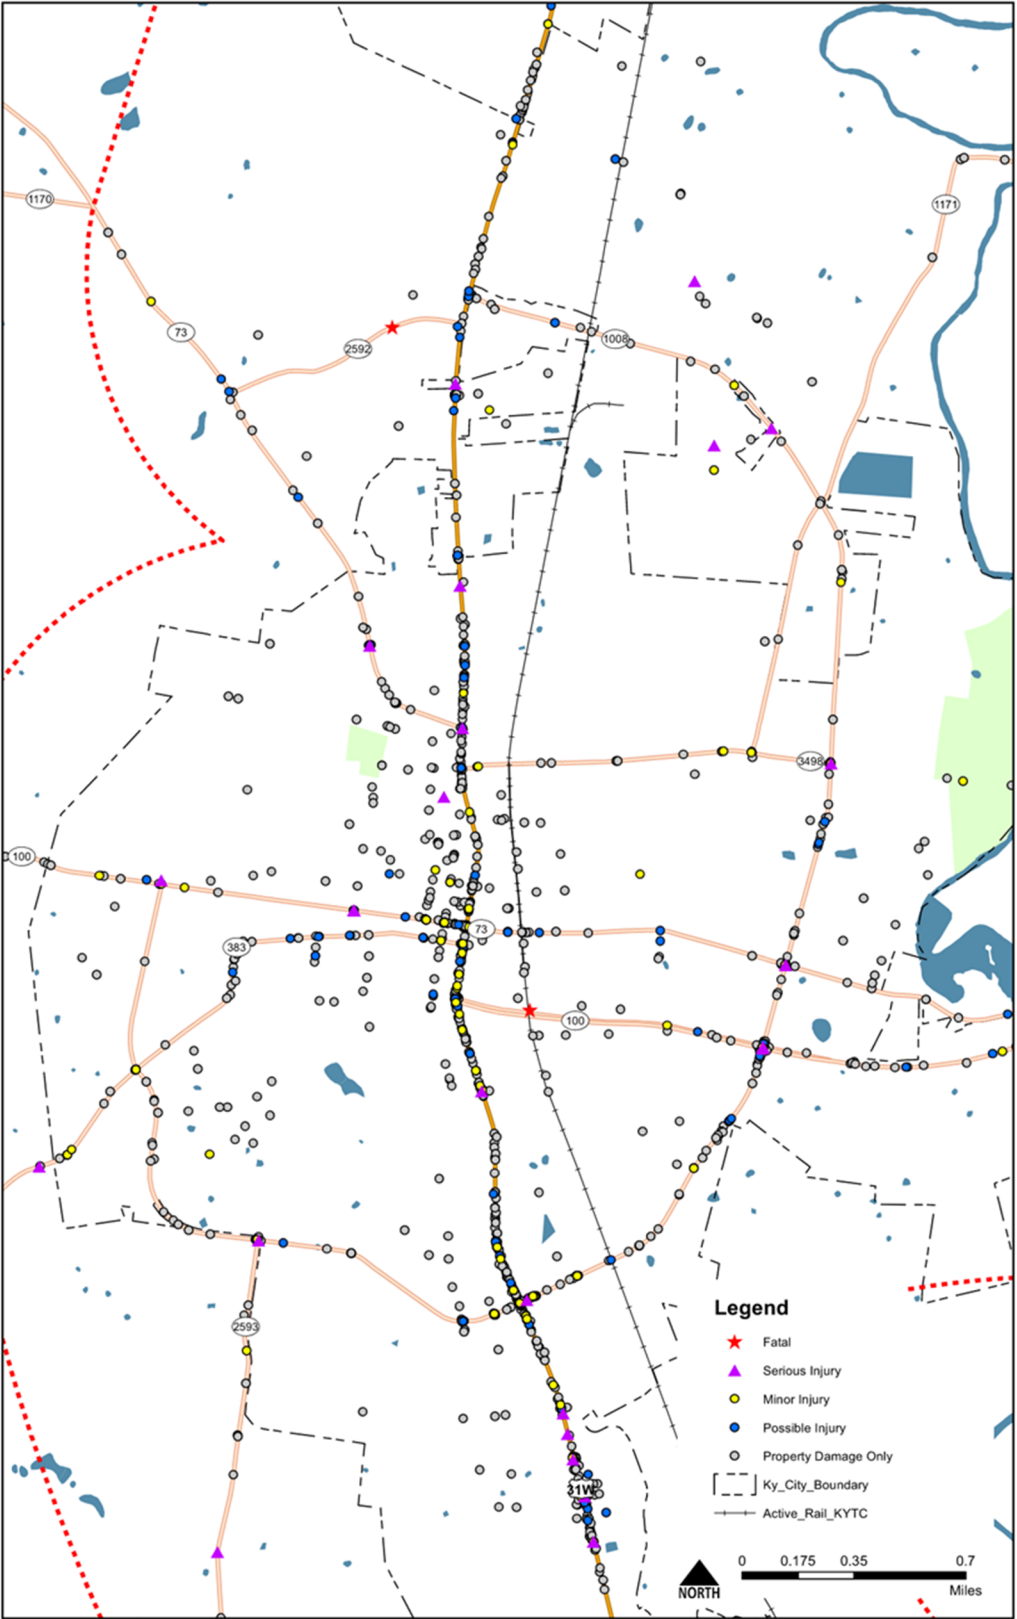

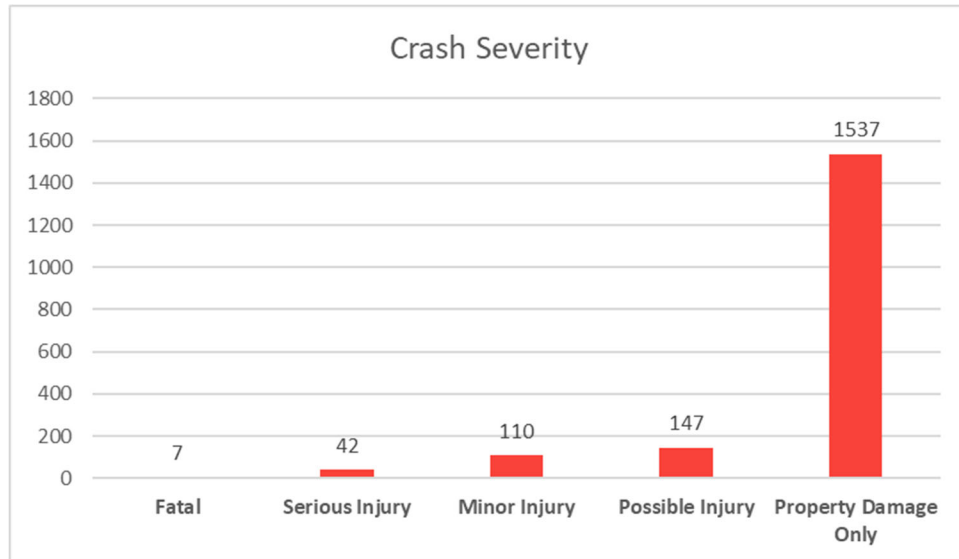

Figure 2: Crash Severity by Location in Downtown Area, 2018-2022

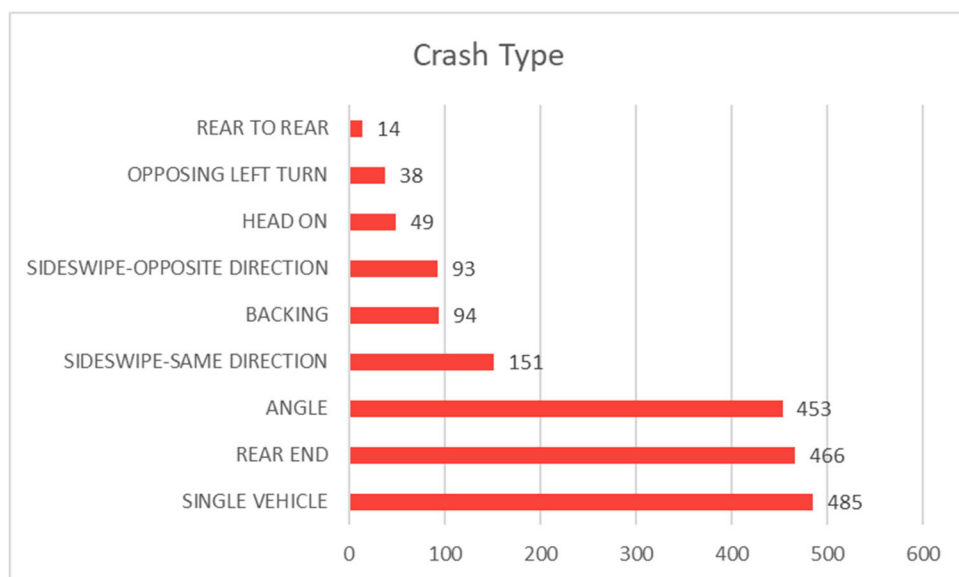

A breakdown of the crashes by severity is shown in **Figure 3**. As shown, there were seven fatal crashes and 42 serious injury crashes (2.7% combined) over the five-year period. Most crashes (1,537, 83.4%) were property damage-only crashes.

Figure 3: Crash Severity, 2018-2022

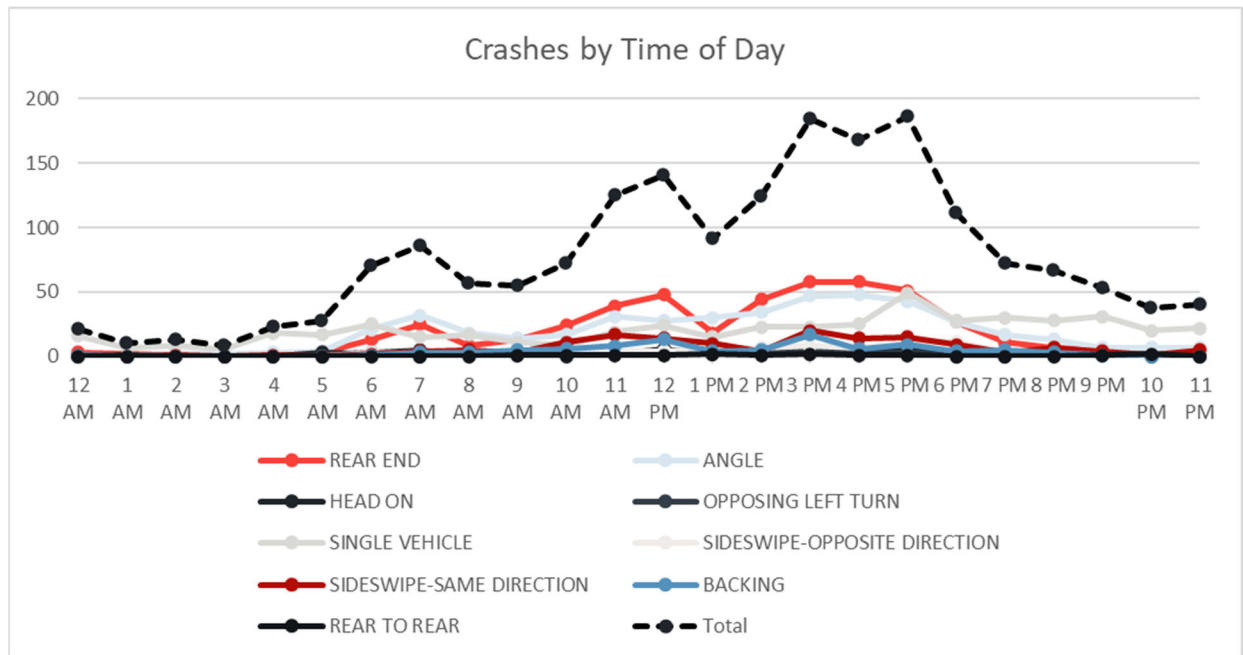

An examination of the crashes by manner of collision is presented in **Figure 4**. Most crashes in the study area (485, 26%) were Single Vehicle crashes, followed closely by Rear End crashes (466, 25%) and Angle crashes (453, 25%). This is consistent with the urban nature of the study area. Head On crashes had the highest average severity of all the categories with 28 of the 49 (57%) involving an injury, six of those severe. It was also noted that six of the seven fatal crashes were Single Vehicle crashes. Commercial vehicles were involved in 8.6% of all reported crashes.

Figure 4: Crashes by Manner of Collision, 2018-2022

A review of crashes by time of day, **Figure 5**, shows that crashes peak in the afternoon, with the largest number of crashes occurring between 3:00PM and 5:00PM.

Figure 5: Crashes by Time of Day, 2018-2022

As shown in **Figure 6**, **Figure 7**, and **Figure 8**, the frequency of crashes related to weather, light condition, and roadway condition was also examined. No unusual patterns were observed, so weather, light, and roadway condition are not of particular interest in the study area.

Figure 6: Weather Related Crashes, 2018-2022

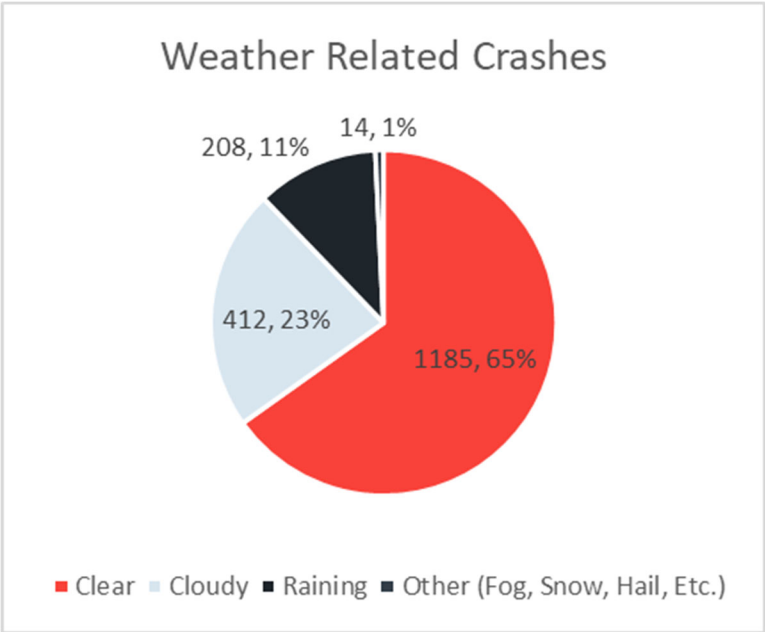

Figure 7: Crashes by Light Condition, 2018-2022

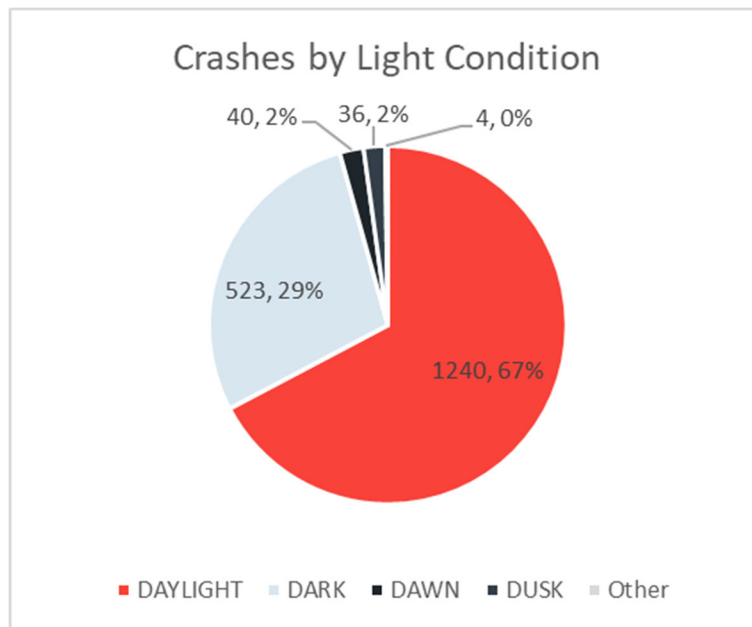

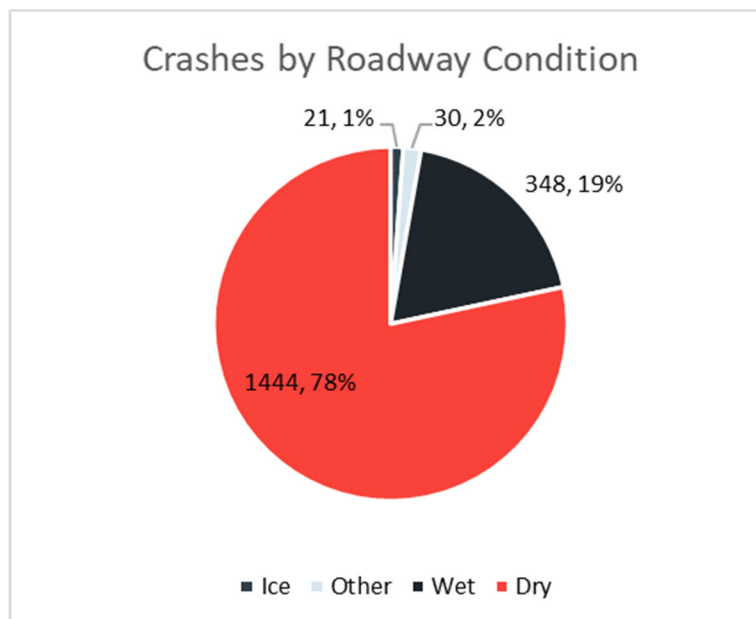

Figure 8: Crashes by Roadway Condition, 2018-2022

The location and density of crashes within the study area was also examined, as illustrated in Figures X and X. Crash density was generally highest in locations with high traffic volumes and at intersections. The figures below specify a few locations of high crash density in the study area.

Figure 9: Crash Density, 2018-2022

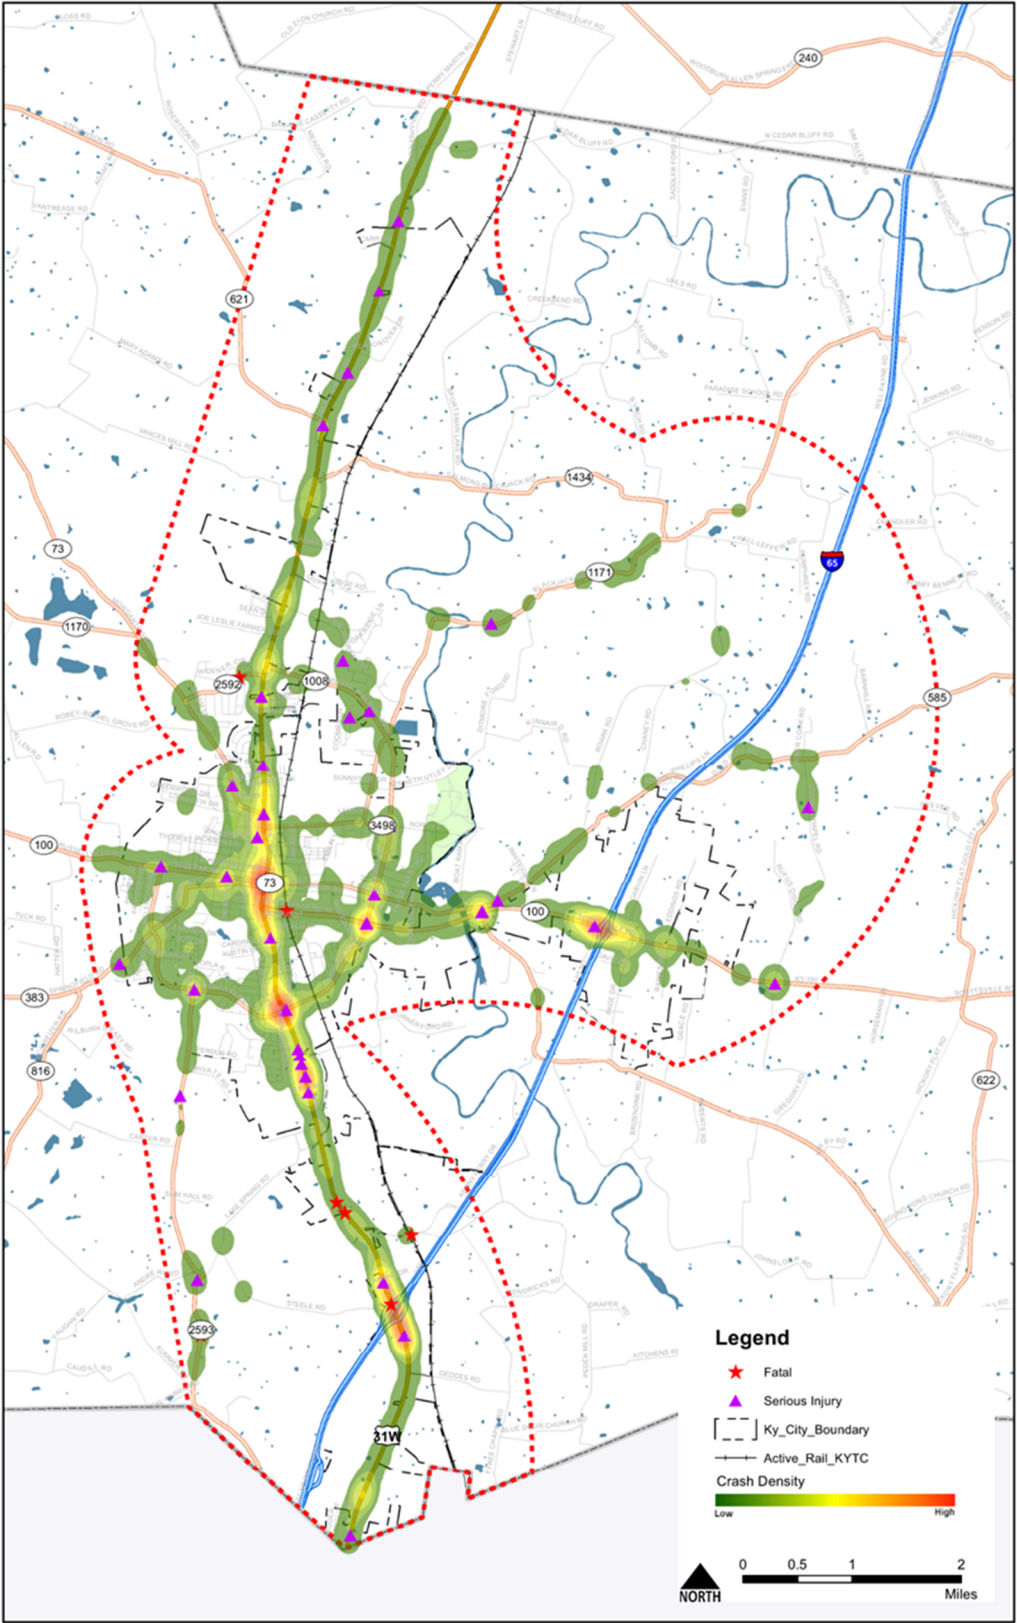

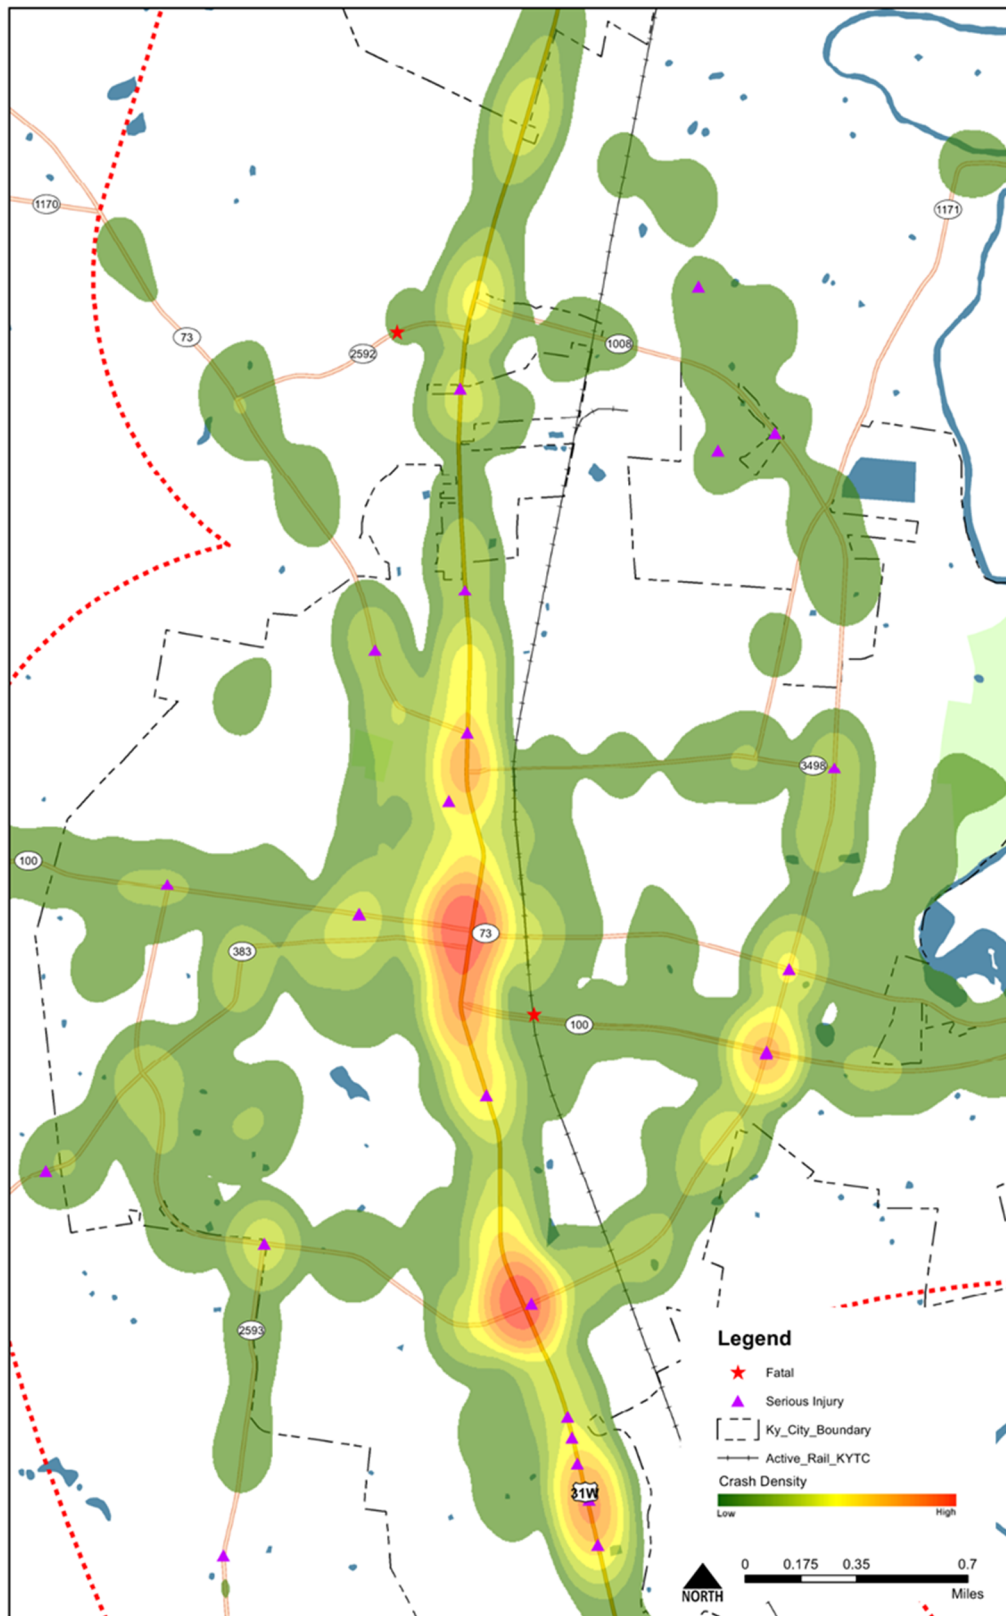

Figure 10: Crash Density in Downtown Area, 2018-2022

During the investigation of specific design issues, the historic crash data along with speed data were used to help identify potential safety related issues.

EXCESS EXPECTED CRASHES

KYTC and the Kentucky Transportation Center (KTC) have developed a more refined statistical methodology based on the Highway Safety Manual (HSM) to rank highway safety needs. Excess Expected Crashes (EEC) is based on a crash prediction model that estimates the number of crashes expected on a roadway segment of a given type and length. It represents the number of excess crashes a segment has experienced compared to other roadways of its type, adjusting for traffic volumes, physical characteristics (for two-lane highways), and the actual crash history. EEC is positive when more crashes have occurred than were expected and negative when fewer crashes occurred than were expected.

Intersection and segment EEC values for routes in the study area were obtained from KYTC and were analyzed and summarized in **Table 1**. Segments were separated into six types based on their typical section and median type, with these being urban and rural two-lane highway, multi-lane undivided highway, and multi-lane divided highway.

Table 1: Summary of EEC Values, 2018-2022

Location	KAB EEC*	CO EEC*	Location Total EEC
Urban Two-Lane	-2.21	-201.52	-203.73
Urban Multilane Undivided	4.48	13.68	18.16
Urban Multilane Divided	-0.09	-4.66	-4.75
Rural Two-Lane	3.41	44.25	47.66
Rural Multilane Undivided	3.95	42.07	46.02
Rural Multilane Divided	8.35	113.31	121.66
Segment Totals	17.89	7.13	25.02
Intersections	-3.39	-259.55	-262.94

*K = Fatal Injury, A = Serious Injury, B = Minor Injury, C = Possible Injury, O = Property Damage Only

The segment types with an overall negative EEC value, indicating that they are experiencing fewer crashes than similar facilities elsewhere in the state, are the urban two-lane and urban multilane divided highways. Intersections also had a negative EEC value, indicating that, in general, there are fewer crashes than expected at intersections in the study area. The other segment types have positive EEC values indicating that more crashes are occurring than expected. The rural multilane divided highway segments show an exceptionally high EEC. The only segments of this type in the study area are near I-65 interchanges (US 31 W south of town at I-65 and KY 100 east of town at I-65).

Figure 11 and **Figure 12** show positive and negative total EEC (including fatal, injury, and property damage only) for segments and intersections. The area experiences a mixture of positive and negative EEC values. Positive EEC values (higher than expected crashes) are in areas of geometric deficiencies and at intersections. Intersections in the study area experience a negative EEC value of -262.95, indicating they experience fewer than the expected number of intersection crashes although many individual intersections experience the opposite. An overall

positive EEC value of 25.02 for segments indicates they experience more than the expected number of segment crashes.

Figure 11: Excess Expected Crashes (EEC) - Full Study Area

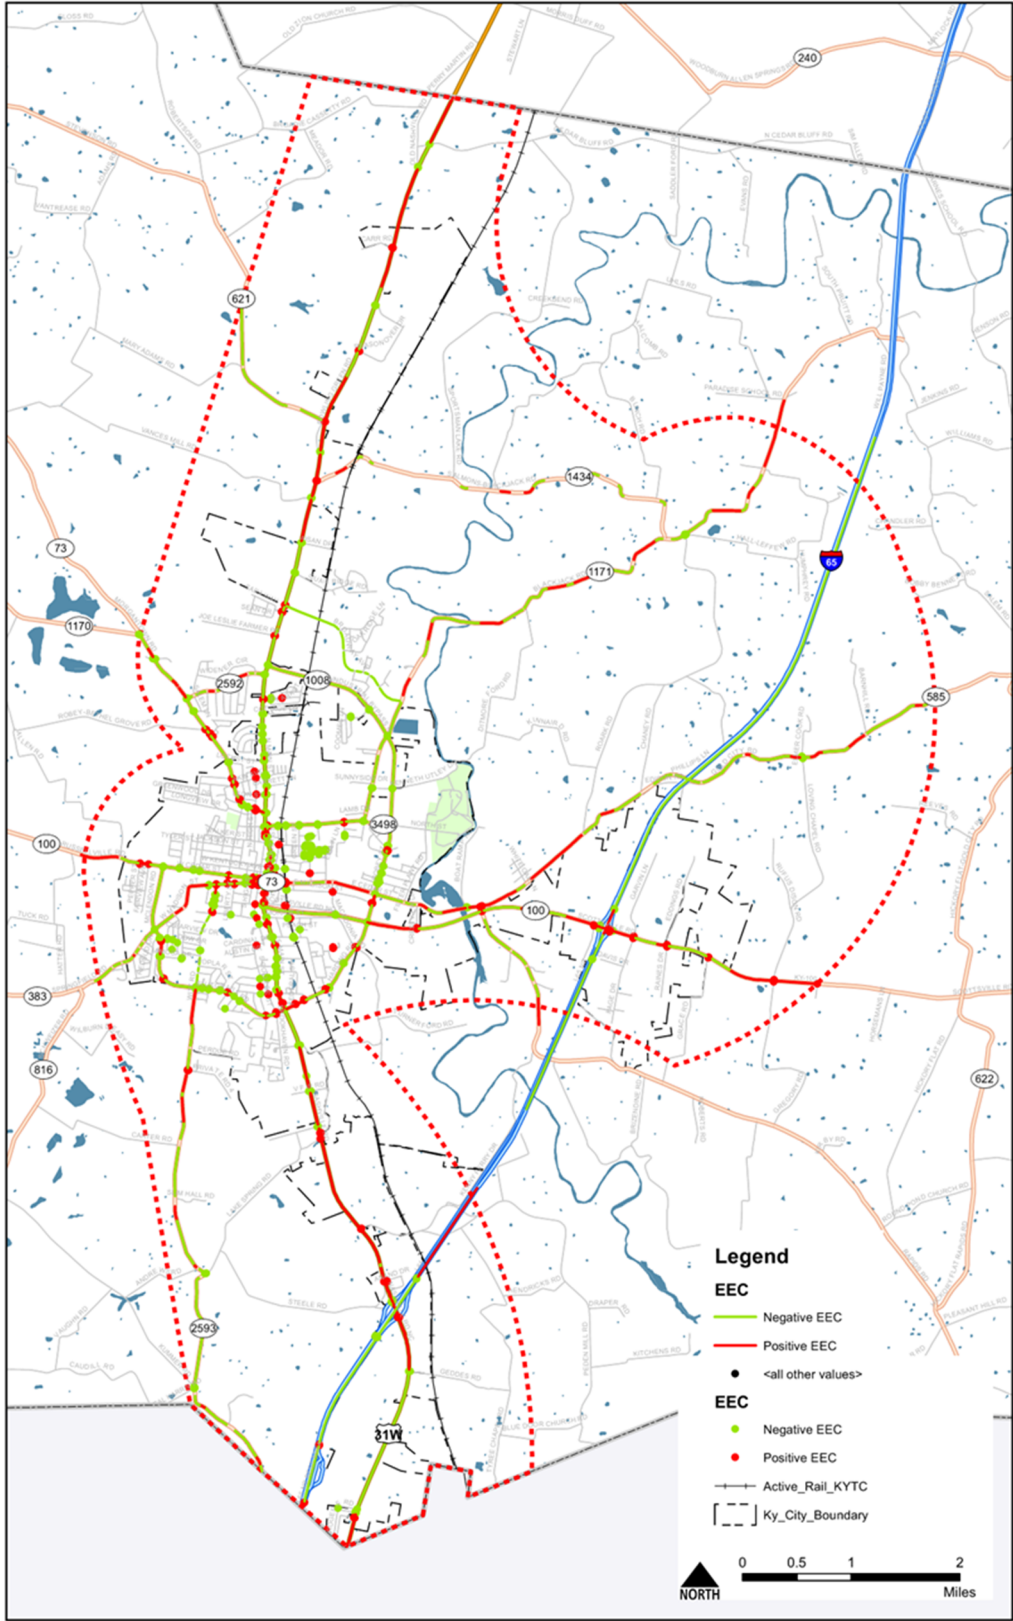

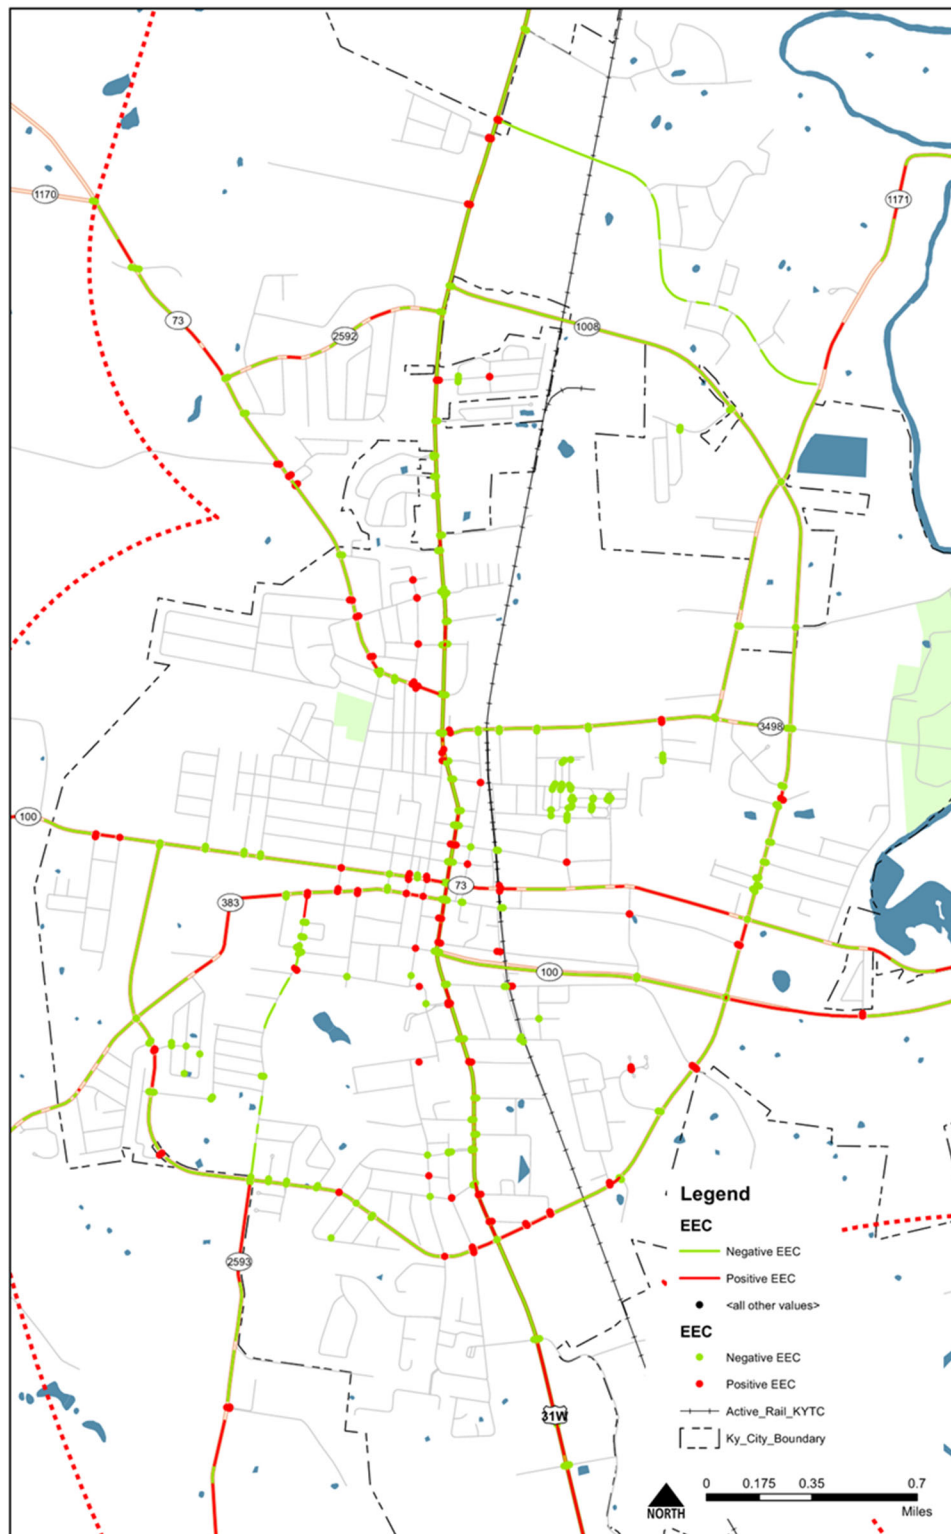

Figure 12: Excess Expected Crashes (EEC) - Detail of Downtown Area
