VALUE ENGINEERING SUMMARY
OF THE
I-75 WIDENING
ITEM NO. 6-16.00
BOONE, KENTON & GRANT COUNTIES
KENTUCKY

SEPTEMBER 8-12, 1997

Prepared by:
William F. Ventry, P.E., C.V.S.

In Association With:

Kentucky Transportation Cabinet

TABLE OF CONTENTS

I. EXECUTIVE SUMMARY

INTRODUCTION

This Value Engineering report summarizes the results of the Value Engineering study performed by Ventry Engineering for the Kentucky Transportation Cabinet. The study was performed during the week of September 8-12, 1997.

The subject of the study was the widening of I-75 in Boone, kenton & Grant Counties.

PROJECT DESCRIPTION

The proposed project is the reconstruction of I-75 by adding an additional lane to the median of the existing I-75 from KY 491 to north of I-71. This is proposed to be accomplished by paving the additional new lanes on the inside as well as the entire median with the full depth of the proposed new pavement design.

It is proposed to replace the existing KY 491 bridge with a new three lane structure.

It is also proposed to replace the haunched portion of the existing KY 14/16 bridge with a new structure and keep the existing AASHTO girder portion.

In addition, the Eads Road bridge is proposed to be jacked up approximately 4 feet to achieve the required vertical clearance over I-75.

METHODOLOGY

The Value Engineering Team followed the basic Value Engineering procedure for conducting this type of analysis.

This process included the following phases:

1. Investigation
2. Speculation
3. Evaluation
4. Development
5. Presentation
6. Report Preparation

Evaluation criteria identified as a basis for the comparison of alternatives included the following:

- Construction cost
- Maintenance cost
- Constructability
- Maintenance of Traffic
- Design life
- Salvage Value
- Pavement Drainage

- Snow/Ice removal or storage
- Vertical and horizontal clearances
- Cross road profiles
- Traffic operations
- Construction time

RESULTS

The following six areas of focus were analyzed by the Value Engineering team and from these areas the following Value Engineering alternatives were developed and are recommended for Implementation:

1-Drainage Blanket

The Value Engineering Team recommends that Value Engineering Alternative No. 1 be implemented. This alternative uses an untreated stone blanket.

If this recommendation can be implemented, there is a possible savings of **$1,008,735.**

What About problems with - paving on untreated stone blanket ? NO

2-KY 14/16 Structure

OK

The Value Engineering Team recommends that Value Engineering Alternative No. 2 be implemented. This alternative replaces the existing bridge with a new structure but does not use a crossover for maintenance of traffic.

If this recommendation can be implemented, there is a possible savings of **$ 461,100.**

3-KY 14/16 Interchange Ramp Revision and Culvert Extension

The Value Engineering Team recommends that the Value Engineering Alternative be implemented. This alternative changes the proposed ramp revision and eliminates the culvert extension and fill.

If this recommendation can be implemented, there is a possible savings of **$ 216,258.**

If there is ~~NO~~ adequate for Area for this OKAY

4-Mainline Overlay and New Pavement Thickness

The Value Engineering Team recommends that the Value Engineering Alternative be implemented. This alternative minimizes the thickness by revising the pavement design.

How was paving design revised?

If this recommendation can be implemented, there is a possible savings of **$1,359,250.**

Do we want to lessen the thickness of the pavement on I-75 ? I think Not

5-Typical Section

The Value Engineering Team recommends that Value Engineering Alternative No. 4B be implemented. This alternative uses an 8 meter depressed median, uses a standard height single slope barrier in the median, uses 12'(3.6m) paved shoulders in the median, reduces the thickness of the median shoulder pavement and/or uses lesser grade of materials for the shoulder pavement in the median and feathers the shoulders down from the edge of pavement on the outside and does nothing outside the existing shoulders.

If we to have use the shoulder for riding surface during phasing or future construction we will loose this saving 3 fold.

If this recommendation can be implemented, there is a possible savings of **$4,534,366.**

6-KY 491 Structure

I thought alternate #1 was on page 3

The Value Engineering Team recommends that Value Engineering Alternative No. 2 be implemented. This alternative salvages the existing bridge by jacking it up to obtain the required vertical clearance and widens the existing bridge to obtain the desired typical section width.

Can be problems jacking old bridges. This must depend on future expansion in this area I am not convince this is WAY to go,

If this recommendation can be implemented, there is a possible savings of **$ 866,800.**

If all the recommendations can be implemented, there is a possible total savings of **$8,446,509.**

INVESTIGATION

The following have been identified by the Value Engineering Team as areas of focus and investigation for the Value Engineering process:

1. **Drainage Blanket**

2. **KY 14/16 Structure**

3. **KY 14/16 Interchange Ramp Revision and Culvert Extension**

4. **Mainline Overlay and New Pavement Thickness**

5. **Typical Section**

6. **KY 491 Structure**

V. SPECULATION PHASE

SPECULATION

Ideas generated, utilizing the brainstorming method, for performing the functions of previously identified areas of focus.

1. DRAINAGE BLANKET

- **Use untreated stone**
- **Use a rock subgrade**
- **Change slope on subgrade and use existing edge drain**
- **Eliminate drainage blanket entirely**
- **Use milled material**
- **Use ground tires**

2. KY 14/16 STRUCTURE

- **Shift the alignment and keep the existing bridge**
- **Cut a notch in the existing haunch and add post-tensioning**
- **Jack the old and new bridges to obtain vertical clearance**
- **Lower I-75 to obtain vertical clearance**
- **Replace with a new bridge but do not use a crossover for maintenance of traffic**

3. KY 14/16 INTERCHANGE RAMP REVISION AND CULVERT EXTENSION

- **Change proposed ramp revision**
- **Eliminate the culvert extension and fill**
- **Provide culvert extension but do not fill over the culvert extension**

4. MAINLINE OVERLAY AND NEW PAVEMENT THICKNESS

- **Minimize the thickness by revising pavement design**
- **Substitute open graded friction course for surface course**

- Eliminate overlay entirely
- Use stage construction for a future resurfacing at ten years
- Break the pavement design north and south of I-71
- Do not mill the existing pavement
- Mill only the bad areas of the existing pavement

5. TYPICAL SECTION

- Use spilt wall with earth fill in median
- Use single slope barrier wall in median
- Reduce thickness of median shoulder pavement
- Reduce the median shoulder width to 12'(3.6m)
- Use lesser grade of materials for the shoulder pavement in the median
- Use permanent precast barrier wall for temporary wall and the use in permanent position in median
- Eliminate or minimize outside ditch regrading
- Modify the proposed outside ditch section
- Minimize the thickness of the outside shoulders
- Use lesser grade of materials on the outside shoulders
- Feather down from the edge of pavement and do nothing to the outside shoulders
- Use standard height barrier in the median
- Use tribeam guardrail in the median
- Use two single face guardrail in the median
- Shift the alignment to the outside to obtain clear zone requirements and eliminate median barrier entirely

6. KY 491 STRUCTURE

- **Salvage the existing bridge by jacking it up to obtain required vertical clearance**
- **Widen the existing bridge to obtain desired typical section**
- **Provide a new bridge but eliminate the proposed crossovers**
- **Construct a new bridge on the existing foundations**
- **Use a single span bridge with MSE walls**
- **Replace with a new four span bridge**
- **Use a steel through bridge**
- **Eliminate proposed widen of the bridge typical by moving turning movement off the bridge**
- **Shift the alignment to obtain better vertical clearance**

VI. EVALUATION PHASE

VI.(a) ALTERNATIVES

ALTERNATIVES

The following alternatives were formulated during the "eliminate and combine" portion of the Evaluation Phase.

1. DRAINAGE BLANKET

Value Engineering Alternative No. 1-Use untreated stone

Value Engineering Alternative No. 2-Change slope on subgrade and use existing edge drain

Value Engineering Alternative No. 3-Eliminate entirely

2. KY 14/16 STRUCTURE

Value Engineering Alternative No. 1-Shift the alignment and keep the existing bridge by jacking the old and new bridges to obtain vertical clearance

Value Engineering Alternative No. 2-Replace with a new bridge but do not use a crossover for maintenance of traffic

3. KY 14/16 INTERCHANGE RAMP REVISION AND CULVERT EXTENSION

Value Engineering Alternative-Change proposed ramp revision and eliminate the culvert extension and fill

4. MAINLINE OVERLAY AND NEW PAVEMENT THICKNESS

Value Engineering Alternative-Minimize the thickness by revising pavement design

5. TYPICAL SECTION

Value Engineering Alternative No. 1-In a 9.2 meter depressed median, use double faced guardrail in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median and minimize the thickness of the outside shoulders and modify the proposed outside ditch section.

Value Engineering Alternative No. 2-In a 9.2 meter raised median, use a standard height single slope barrier wall or a split barrier with earth fill in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median, minimize the thickness of the outside shoulders and modify the proposed outside ditch section.

Value Engineering Alternative No. 3-In a 9.2 meter raised median, use a double face guardrail in the median, 10' paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median, minimize the thickness of the outside shoulders and modify the proposed outside ditch section.

Value Engineering Alternative No. 4-In a 8 meter depressed median, use a standard height single slope barrier in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median and feather down from the edge of pavement and do nothing to the outside shoulders.

Value Engineering Alternative No. 5-In a 8 meter depressed median, use double faced guardrail in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median and feather down from the edge of pavement and do nothing to the outside shoulders.

6. KY 491 STRUCTURE

Value Engineering Alternative No. 1-Salvage the existing bridge by jacking it up to obtain required vertical clearance and widen the existing bridge to obtain desired typical section

Value Engineering Alternative No. 2-Provide a new two span bridge but eliminate the proposed crossovers

Value Engineering Alternative No. 3-Construct a new bridge on the existing foundations and replace with a new four span bridge

VI.(b) ADVANTAGES AND DISADVANTAGES

EVALUATION

The following Advantages and Disadvantages were developed for the Value Engineering Alternatives previously generated during the speculation phase. It also includes the Advantages and Disadvantages for the As Proposed.

1. DRAINAGE BLANKET

"As Proposed"-Use treated stone blanket

Advantages

- **May extend pavement life on a portion of the project**
- **Adds structural support**

Disadvantages

- **High construction cost**
- **Treatment of stone may not be required**
- **Blanket will only be under a portion of the final typical section**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 1-Use untreated stone blanket

Advantages

- **May extend pavement life on a portion of the project**
- **Adds structural support**
- **Medium construction cost**

Disadvantages

- **Blanket will only be under a portion of the final typical section**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 2-Change slope on subgrade and use existing edge drain

Advantages

- May reduce the volume of blanket required
- Medium construction cost
- Median drain pies would not be required

Disadvantages

- Would require more bituminous material
- Existing drain pipe will be under pavement
- Existing drain pipe may be damaged during construction

Conclusion:
Eliminate from further Evaluation

Value Engineering Alternative No. 3-Eliminate entirely

Advantages

- Low construction cost
- Less construction time

Disadvantages

- Reduced pavement life

Conclusion:
Eliminate from further Evaluation

2. KY 14/16 STRUCTURE

"As Proposed"-Replace the haunched portion of the bridge with a new AASHTO girder portion and leave the existing AASHTO portion as is

Advantages

- Achieves required vertical clearance
- Matches existing profile

Disadvantages

- **Constructability**
- **Maintenance of traffic on I-75**
- **High construction cost**
- **Does not salvage to remaining life of the existing bridge**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 1-Shift the alignment and keep the existing bridge by jacking the old and new bridges to obtain vertical clearance

Advantages

- **Salvages the remaining life of the existing bridge**
- **Less maintenance of traffic on I-75**
- **Medium construction cost**
- **Achieves vertical clearance**

Disadvantages

- **Changes profile on KY 14/16**
- **More maintenance of traffic on KY 14/16**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 2-Replace with a new bridge but do not use a crossover for maintenance of traffic

Advantages

- **Medium construction cost**
- **Achieves required vertical clearance**
- **Matches existing profile**
- **Less maintenance of traffic on I-75**

Disadvantages

- **Constructability**
- **Does not salvage to remaining life of the existing bridge**

Conclusion:
Recommend to be carried forward for further Evaluation

3. KY 14/16 INTERCHANGE RAMP REVISION AND CULVERT EXTENSION

"As Proposed"-Revise the ramp layout and extend the existing box culvert and fill over the extended box culvert

Advantages

- **Provide two lanes on the ramp**

Disadvantages

- **May cause operation conflicts on the ramp**
- **High construction cost**
- **More culvert maintenance**
- **Possible conflict with sanitary sewer**
- **Requires borrow for fill over culvert**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative-Change proposed ramp revision and eliminate the culvert extension and fill

Advantages

- **Eliminates need for borrow**
- **Medium construction cost**
- **Less conflict with sanitary sewer**
- **Less culvert maintenance**

Disadvantages

- **None apparent**

Conclusion:
Recommend to be carried forward for further Evaluation

4. MAINLINE OVERLAY AND NEW PAVEMENT THICKNESS

"As Proposed"-5 1/2 "

Advantages

- **Extended pavement life**
- **Better riding surface**

Disadvantages

- **High construction cost**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative-Minimize the thickness by revising pavement design

Advantages

- **Lower construction cost**
- **Extended pavement life**
- **Better riding surface**

Disadvantages

- **None apparent**

Conclusion:
Recommend to be carried forward for further Evaluation

5. TYPICAL SECTION

"As Proposed"-In a 9.2 meter depressed median, use high barrier in the median, 14' full depth(same as mainline) paved shoulders in the median, 10' full depth(same as mainline) thickness outside shoulders and regrade all the existing ditches and slopes on the outside

Advantages

- **More snow storage area in median**
- **Excess capacity in shoulders**
- **Excavation of outside area to new criteria**
- **Good pavement drainage**

Disadvantages

- **High construction cost**
- **Disturbs the existing area outside the existing shoulders**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 1-In a 9.2 meter depressed median, use double faced guardrail in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median and minimize the thickness of the outside shoulders and modify the proposed outside ditch section

Advantages

- **Medium construction cost**
- **More snow storage in median**

Disadvantages

- **Increased guardrail maintenance**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 2-In a 9.2 meter raised median, use a standard height single slope barrier wall or a split barrier with earth fill in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median, minimize the thickness of the outside shoulders and modify the proposed outside ditch section

Advantages

- **No median drains required**
- **Medium construction cost**

Disadvantages

- **Poorer roadway cross-slope drainage**
- **Increased snow and ice removal**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 3-In a 9.2 meter raised median, use a double face guardrail in the median, 10' paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median, minimize the thickness of the outside shoulders and modify the proposed outside ditch section

Advantages

- **No median drains required**

- Low construction cost

Disadvantages

- Poorer roadway cross-slope drainage
- Increased snow and ice removal
- Increased guardrail maintenance

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 4-In a 8 meter depressed median, use a standard height single slope barrier in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median and feather down from the edge of pavement and do nothing to the outside shoulders

Advantages

- Snow storage
- Low construction cost
- Low maintenance cost
- Good pavement drainage
- Less outside ditch maintenance

Disadvantages

- Does not utilize 4' of existing paved shoulder

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 5-In a 8 meter depressed median, use double faced guardrail in the median, 12'(3.6m) paved shoulders, reduce the thickness of the median shoulder pavement and/or use lesser grade of materials for the shoulder pavement in the median and feather down from the edge of pavement and do nothing to the outside shoulders

Advantages

- Snow storage
- Lowest construction cost
- Good pavement drainage
- Less outside ditch maintenance

Disadvantages

- Does not utilize 4' of existing paved shoulder
- More guardrail maintenance

Conclusion:
Recommend to be carried forward for further Evaluation

6. KY 491 STRUCTURE

"As Proposed"-remove the existing bridge and replace with a two span AASHTO girder structure

Advantages

- Provide new HS 25 structure
- Increases the capacity of the crossroad

Disadvantages

- Raises the existing profile by approximately 6'
- High construction cost
- Difficult maintenance of traffic on I-75
- Does not salvage the remaining life of the existing bridge

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 1-Salvage the existing bridge by jacking it up to obtain required vertical clearance and widen the existing bridge to obtain desired typical section

Advantages

- Reduces the maintenance of traffic on I-75
- Uses the remaining life of the existing bridge
- Low construction cost

Disadvantages

- Raises the existing profile grade approximately 4'
- Some increase in maintenance of traffic on KY 491

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 2-Provide a new two span bridge but eliminate the proposed crossovers

Advantages

- **Provide new HS 25 structure**
- **Increases the capacity of the crossroad**
- **Less maintenance of traffic on I-75**

Disadvantages

- **Raises the existing profile by approximately 6'**
- **High construction cost**
- **Does not salvage the remaining life of the existing bridge**

Conclusion:
Recommend to be carried forward for further Evaluation

Value Engineering Alternative No. 3-Construct a new bridge on the existing foundations and replace with a new four span bridge

Advantages

- **Low to medium construction cost**
- **Minimizes profile grade changes**
- **Reduced maintenance of traffic on I-75**

- **New superstructure**
- **Salvages the remaining life of the foundations of the existing bridge**
- **Can meet HS 25 on superstructure**

Disadvantages

- **None apparent**

Conclusion:
Recommend to be carried forward for further Evaluation

VI.(c) EVALUATION MATRIX

***NOTE:** **Matrices are used to determine a preferred alternative when more than one competing Alternative to the "As Proposed" Alternative survives the advantages and disadvantages process.**

EVALUATION MATRIX

TYPICAL SECTION

4- VERY GOOD 3 - GOOD 2 - FAIR 1 - POOR	CONSTRUCTION COST	MAINTENANCE COST	PAVEMENT DRAINAGE	SNOW/ICE REMOVAL/STORAGE	OUTSIDE DITCH EARTHWORK	MEDIAN DRAINAGE			TOTAL SCORE	RANKING

VII. DEVELOPMENT PHASE

VII.(a) DRAINAGE BLANKET

VII.(a)(1) AS PROPOSED

"As Proposed"

The proposed design calls for a drainage blanket (Type II - Asphalt) placed to a depth of 260 mm under the widened pavement and median shoulder.

VII.(a)(2) V.E. ALTERNATIVE

V.E. Alternative

The V.E. Alternative proposes to utilize an untreated drainage blanket 260mm in depth in lieu of the asphalt treated. Since the primary function of the drainage blanket is to drain water percolating through the pavement structure to the perforated underdrain, the untreated crushed and graded material should adequately convey any water that may collect under the pavement structure.

DRAINAGE BLANKET
COST COMPARISON

DESCRIPTION	UNIT COST	PROP'D QTY.	PROP'D COST	V.E. QTY.	V.E. COST
DRAINAGE BLANKET TYPE II ASPHALT	$22.00	80,000MT	$1,760,000	0	0
DRAINAGE BLANKET TYPE I - UNTREATED	$ 9.58	0	0	78,420/MT	$751,265
TOTAL			$1,760,000		$751,265

Possible Savings $ 1,008,735

VII.(b) KY 14/16 STRUCTURE

VII.(b)(1) AS PROPOSED

"As Proposed"

The existing bridge is a 2 span reinforced concrete deck girder (RCDG) bridge that has been widened with prestressed concrete I beams (PCIB). The "As Proposed" is to remove the RCDG portion of the bridge and replace it with PCIB beams. This scheme uses a maintenance of traffic (MOT) that utilizes a traffic crossover. This crossover is estimated to cost $521,068 and does not include the MOT cost for traffic on KY 14/16.

VII.(b)(2) V.E. ALTERNATIVES

V.E. Alternative No. 1

The V. E. Alternative No. 1 is to jack each portion of the existing KY 14/16 bridge approximately .57 meters higher than the present elevation. This will provide 5 meters of vertical clearance. The alignment of I-75 is shifted .6 meters to the outside to minimize the amount of jacking. The .56 meter of elevation change will affect the KY 14/16 and four ramps. This alternative will minimize the maintenance of traffic (MOT). The "As Proposed" requires an expensive crossover of I-75 traffic and MOT of KY 14/16. The V. E. Alternative 1 does not require major I-75 MOT costs. The V. E. Alternative costs $270,886 less than the "As Proposed".

V.E. Alternative No. 2

The V.E. Alternative No. 2 is the same as the "As Proposed" except the maintenance of traffic plan for the V.E. Alternative No. 2 does not utilize a crossover. The V.E. Alternative No. 2 utilizes the on/off ramps to divert traffic during the demolition of the existing spans over traffic and erection of new beams. The MOT plan is detailed in the MOT plan. The V.E. Alternative No. 2 costs $461,068 less than the "As Proposed". This is the recommended alternative.

CONSTRUCTION PROJECT NO. 12-SEP-1997
MAINTENANCE PROJECT NO. A12B
DRAWING NO.

48

LETTING DATE

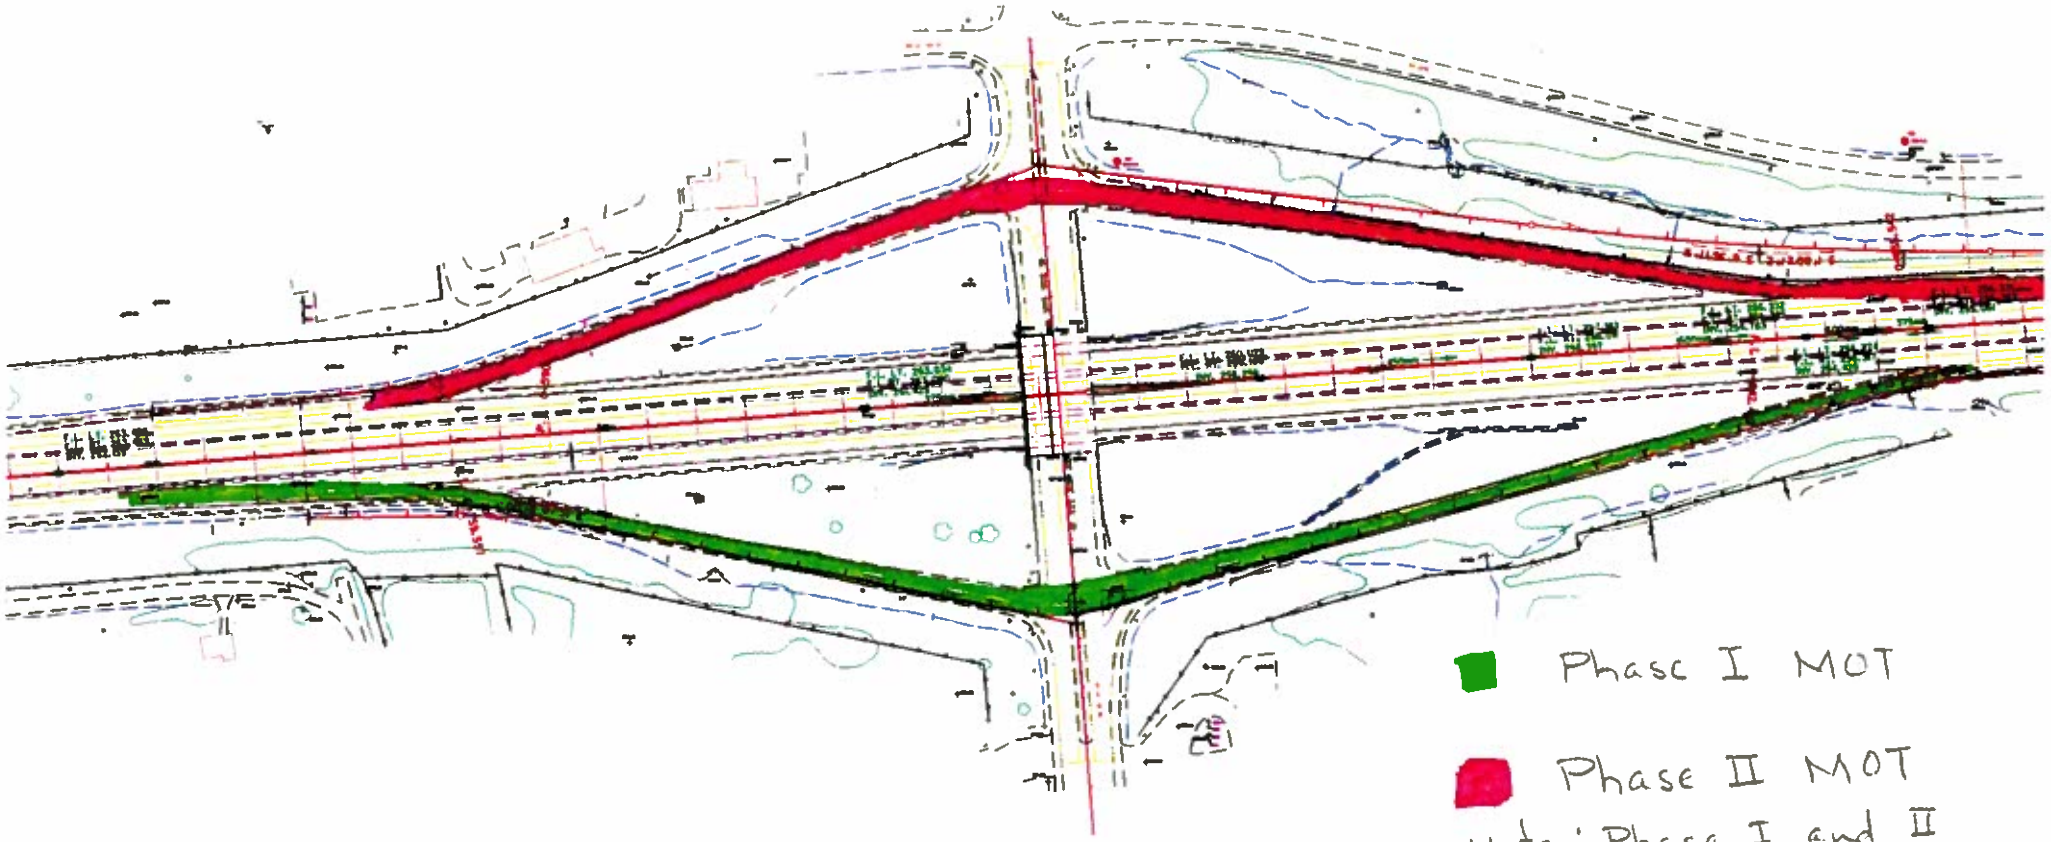
The "As Proposed" KY 14/16 bridge utilizes a crossover to maintain I-75 traffic during demolition and construction. The estimated cost of the crossover is $521,000. The V.E. proposal is to utilize the on/off ramps at the I-75/KY 14/16 interchange to detour I-75 traffic. The detours would only be used during off peak hours.

The MOT plan is to restrict the I-75 traffic to one lane and detour the traffic to the off ramp across KY 14/16 and onto the on ram proceeding onto I-75. The existing bridge will be removed in sections. The prestressed concrete AASHTO girder portion of the bridge will remain in place and be used to maintain KY 14/16 traffic. I-75 will be diverted to demolition the reinforced concrete deck girder portion of the existing bridge and erect the new beams.

The need for diverting traffic will be as follows.

2 nights to demolition RCDG Bridge
2 nights to set beams
1 night to cast deck

Total 5 nights and $10,000 for additional MOT of KY 14/16.



KY 14-16 MOT

VII.(c) KY 14/16 INTERCHANGE RAMP REVISION AND CULVERT EXTENSION

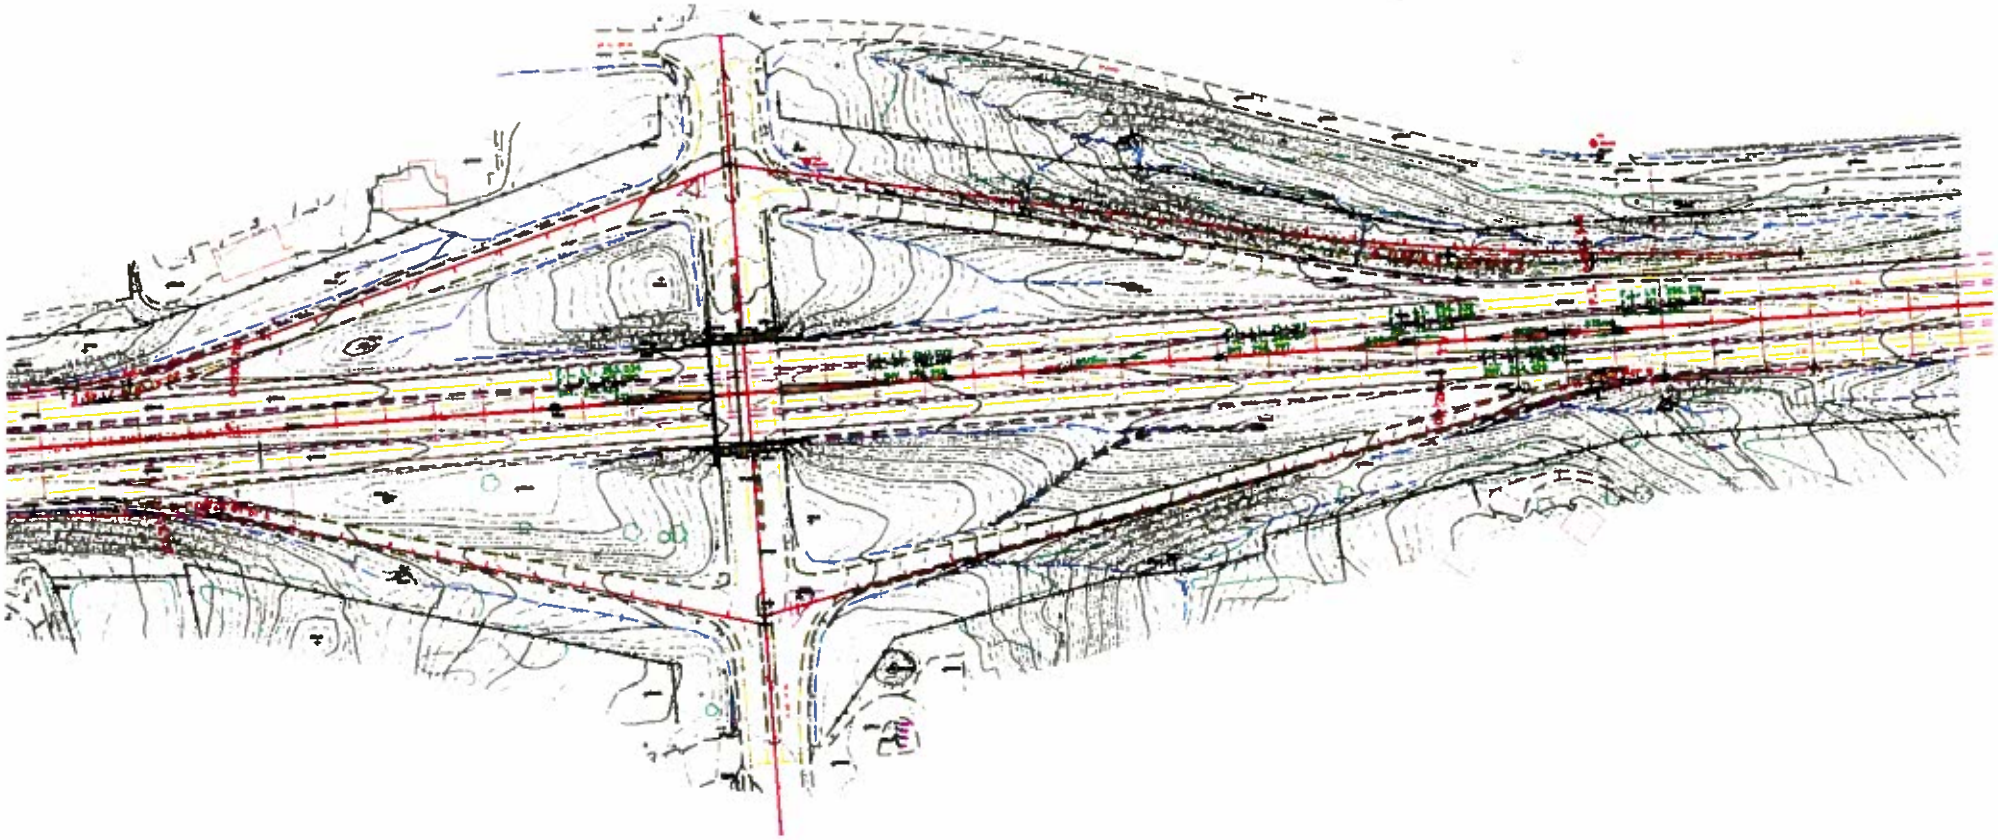
VII.(c)(1) AS PROPOSED

"As Proposed"

The proposed plan for the interchange improvements include upgrading the ramp terminals on I-75 to meet present day design standards and minor improvements to the ramp intersections with KY 14/16. All of the existing ramp alignments are generally maintained with the exceptions of Ramp D which has been shifted to the west and widened to two lanes to provide additional ramp storage for the high volume of trucks from SB I-75 destined for the large truck terminal on the west side of KY 14/16 immediately west of the ramp intersections. Access to the truck terminal is from KY 14/16. It has been recognized that there is insufficient spacing between the ramp D & A intersections with KY 14/16 and the KY 1292/KY 14/16 intersection to provide desirable traffic operations. The distance between these two intersections is approximately 50m. The only feasible means of correcting this condition is to relocate KY 1292 and KY 14/16 to the west which has been considered to be beyond the scope of the I-75 corridor improvements.

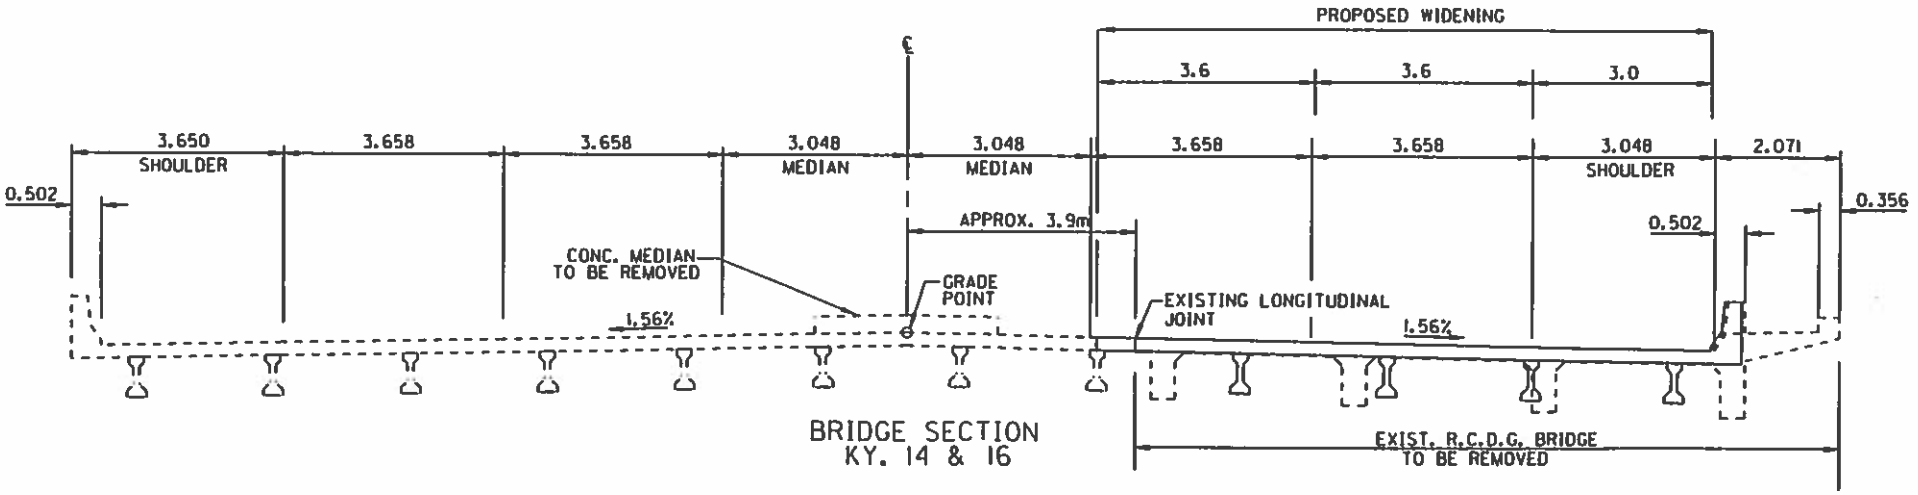
In addition to the ramp improvements, the proposed plan also includes the combining and extending of concrete box culverts under and along the west side of ramp D.

The proposed ramp alignment and culvert locations are shown on the following sheet. The existing raised median on the interchange structure is being removed and single lane left turn lanes and two through lanes are being provided in each direction as shown in the typical section. The existing profile of KY 14/16 is being maintained through the interchange area.



AS PROPOSED

AS PROPOSED



AS PROPOSED

VII.(c)(2) V.E. ALTERNATIVE

V.E. Alternative

The V.E. Alternative for the KY 14/16 interchange is described as follows.

- Upgrade ramp terminals on I-75 to current design standards as now proposed.
- Widen Ramp D to 2 lanes generally following the existing ramp alignment as shown on the following sheets. See cross section drawings for the elimination of a major portion of the culvert extension. Widen Ramp C to accommodate double left turning traffic.
- Provide 2 lane ramp exits and entrances at ramp intersections with KY 14/16 as shown in the Value Engineering plans.
- Provide 2 through lanes in each direction on KY 14/16 between ramp terminals. Provide 2 eastbound left turn lanes, 1 westbound left turn lane, and a flush median as shown on the Value Engineering KY 14/16 typical section.
- Provide inter-connected traffic signals at the three intersections in the interchange area.

Cost Comparison

The cost comparison indicates that the V.E. Alternative would result in a savings of approximately $216,288. This reduction in cost is due primarily to maintaining Ramp D on the existing ramp alignment to the extent possible and the elimination of the large box culvert extension. The proposed design called for placing waste material along the westerly side of Ramp D; however it has been determined that the proposed construction contract for this section of I-75 requires borrow material and it therefore, becomes more costly to place fill in this areas where it is not required to develop the widened ramp section.

Traffic Analysis

Traffic volumes provided by the department for the KY 14/16 interchange included in this section. The design hourly volumes significantly exceed the volume warrants for signalized intersections particularly with the high percentage of trucks. An inter-connected signal system for the three intersections in the interchange area have therefore been included in the V. E. Alternative.

As shown in the traffic volume sheets, two critical volumes in the interchange include the high volumes of left turning traffic from eastbound KY 14/16 to NB I-75 in the p.m., (800 vph including high truck percent), and traffic from SB I-75 to westbound KY 14/16 (976 vph), also in the p.m. Two left turn lanes are definitely needed and are therefore proposed for the 800 vph left turning traffic onto NB I-75. As shown in the typical section, two left turn lanes in the eastbound direction can be provided by eliminating the shoulders on the interchange structure.

Although two right turn lanes should be provided for the 975 vph right turning traffic from the SB I-75 off ramp, the short distance between the ramp intersections 50M and the intersection serving the truck terminal prohibit the development of two right turn lanes, particularly in view of the high volume of trucks from the SB off-ramp proceeding to the truck terminal.

A capacity analysis of the merge of Ramp C with NB I-75 was made, using the Highway Capacity Analysis procedure. As noted in the data sheet, the merging ramp should operate at Level of Service C.

Summary

Because of the estimated construction cost savings and the additional traffic capacity provided by providing two left turn lanes for the high volume left turning traffic NB I-75, it is recommended that this V.E. Alternative be adopted.

VII.(d) MAINLINE PAVEMENT OVERLAY AND NEW PAVEMENT THICKNESS

VII.(d)(1) AS PROPOSED

"As Proposed"

The "As Proposed" pavement is based on 59 million EAL's loading. This loading required a 5.5 inch thick pavement overlay that dictates the thickness of the new pavement widening.

VII.(d)(2) V.E. ALTERNATIVE

V.E. Alternative

During the V.E. evaluation, we investigated the reasonableness of the design pavement loading. The design ESL's were evaluated and the ESL forecasts were not consistently determined between the project sections. The design ESL's varied from 30 million to 59 million in this 8 mile section.

Our review determined that the variation was due to the lane distribution factor and not a change in the ADT or the midpoint design ESL's. The midpoint design ESL's was relatively constant at approximately 12,000.

The V.E. team determined that a reasonable design ESL's should be 40 million. The V.E. team recomputed the required structural number to be 7.3 verses the "As Proposed" structural number of 8.1. The revised structural number resulted in a new pavement thickness of 4 inches. The pavement layers were adjusted to the structural number of 7.3. See next page for the pavement layer thickness.

The cost savings: $1,359,200.

INTRA-DEPARTMENTAL MEMO

TO: William Crace, Director
Division of Operations

FROM: Bruce S. Siria, Director
Division of Transportation Planning

DATE: April 15, 1996

SUBJECT: Grant, Kenton and Boone Counties Traffic Forecast
I-75 from M.P. 165.79 to M.P. 173.50

In response to your August 10, 1995 e-mail requesting traffic forecasts on the subject project, we are providing current year ADTs, 2006 design year ADTs, 2016 design year ADTs, and estimated equivalent axleload accumulations on the attached map and worksheets.

If you have any questions, please call Rob Bostrom of this Division.

161	BIT SURF CL I-20/30 PG76-22/ER	30mm DEPTH
356	BITUMINOUS MATERIAL FOR TACK	SEE PLAN NOTE NO. 453

NOTES:

(1) The Contractor is advised that the compaction of asphalt mixtures furnished for mainline usage, at 25mm (one inch) or greater, on this project will be accepted by OPTION A of the **Special Note for Control and Acceptance of Asphalt Mixtures (8b)**. The compaction of all other asphalt mixtures will be accepted by OPTION B.

(2) The stabilized aggregate base shall be accomplished utilizing the existing DGA in place. (See attached Special Note).

(3) FABRIC-GEOTEXTILE TYPE IV and CRUSHED AGGREGATE SIZE NO 57 shall be incidental to the Contract Unit Bid Price for PERFORATED PIPE-150mm.

(4) All longitudinal pipe drainage systems for the pavement drainage blanket shall be outletted to a Median Box Inlet. Outlets shall be in a fill section whenever possible. Outlet spacing shall not exceed 150 meter except grades 1% or less, then the spacing of outlets shall not exceed 75 meter. All sags shall have an outlet. The Design Engineer shall spot these on the plans or in the proposal.

(Cont. on Sheet No. 3)

NOTES (Cont.)

(5) For superelevated sections, the pavement drainage blanket for widening to the inside shall be constructed so as to provide positive drainage (2% or greater to the PERFORATED PIPE-150mm in the median.

(6) The Division of Transportation Planning has three sets of traffic counting loops imbedded in the existing pavement at milepoints 170.0, 172.1 and 174.1. The site at milepoint 170.0 has two loops per lane in both the north and southbound directions for a total of 12 loops. The site at milepoint 172.1 has one loop per lane in both the north and southbound directions for a total of six loops. The site at 174.1 has two loops per lane in both the north and southbound directions for a total of 12 loops. The Contractor will install a total of 30 loops in the new pavement. Installation shall be coordinated with and approved by the Division of Planning. See the attachment labeled "Special Notes for Installation of Traffic Loops and Piezoelectric Sensors" for quantities of materials and installation details.

(7) Mill Open Graded Friction Course before overlay is applied.

VII.(e) TYPICAL SECTION

VII.(e)(1) AS PROPOSED

"As Proposed"

Shoulder Pavement - Overlay

- The "As Proposed" shoulder pavement is based on 59 million EAL's loading and full depth shoulders. This loading required a 5.5 inch thick pavement overlay.

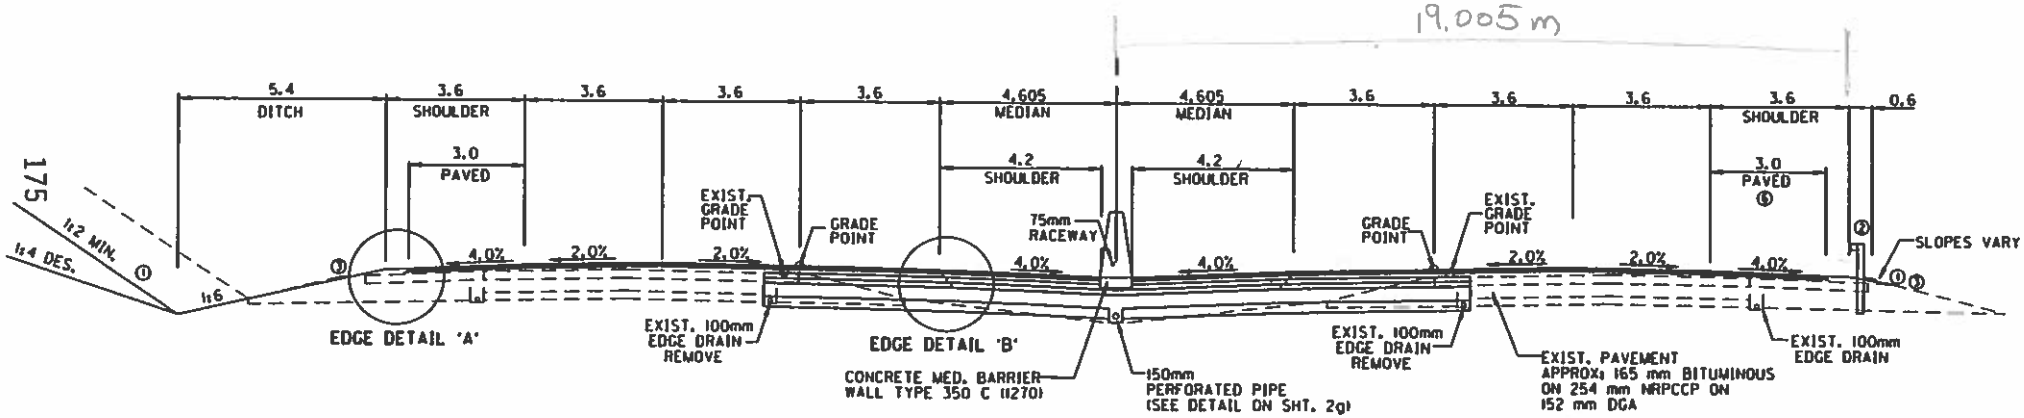
Shoulder Pavement - Widening

- The "As Proposed" shoulder pavement is based on 59 million EAL's loading and full depth shoulders. This loading required a 31.5 inches thick pavement.

As shown on the following typical section, the "As Proposed" rehabilitation of I-75 incorporates the following features.

- Adds an additional lane in the median area providing 3 lanes in each direction on I-75.
- Provides a full depth pavement section for the median area 14' (4.6m) on either side of the proposed high wall traffic barrier located on the centerline .
- Incorporates a two foot lateral shift in the pavement section toward the median.
- Flattens the outside slopes, requiring the removal of additional earthwork for embankment and excavation.
- Overlaps the existing four lanes (asphalt concrete surface) with a total asphalt concrete thickness. Since the proposed pavement overlay (including additional lane) and drainage blanket have been included in preceding sections of this report, this section is limited to an analysis and discussion of the typical section, excluding the pavement resurfacing, the additional pavement lane, and the drainage blanket.

AS PROPOSED



AS PROPOSED

VII.(e)(2) V.E. ALTERNATIVES

V.E. Alternative

Outside Shoulder Pavement - Overlay

During the V.E. evaluation, we investigated the shoulder overlay thickness. The V.E. team recommends that the pavement thickness be reduced from 5.5 inches to 4 inches; therefore the V.E. team determined that the outside shoulder overlay should be 4 inches. In addition, we determined that the outside shoulder overlay can be tapered from 4 inches to 1.5 inches and still meet the required shoulder EAL loading.

Median Shoulder Pavement - Widening

During the V.E. evaluation, we investigated the shoulder pavement thickness. The mainline pavement thickness was reduced from 31.5 inches to 30 inches; therefore the V.E. Team determined that the median shoulder pavement thickness could be reduced. In addition, we determined that the shoulder pavement layers can be adjusted by using a thicker layer of lower cost Drainage Blanket to replace higher cost Bituminous Base. The new thickness satisfies the shoulder structural number of 6.3.

As shown in the typical sections, V.E. Alternatives 4A and 4B are described as follows.

- Both alternatives have an overall median width of 26' with a traffic barrier. The outside shoulder is identical for both alternatives.
- Alternative 4A incorporates the full depth pavement section under the 12'(3.6m) wide paved median shoulder and a traffic barrier with a constant slope face. The embankment and cut slopes have been revised to incorporate desirable ditch and clear zone widths.
- Alternative 4B is identical to Alternative 4A with the exception of the 12'(3.6m) paved median shoulder which has a reduced shoulder pavement thickness and the existing outside embankment and cut slopes have been retained.
- Both alternatives provide an additional lane in each direction on I-75.

The summary of the shoulder pavement structural analysis for V.E. alternative 4B is shown on the following pages.

Cost Comparison

The primary difference in the proposed typical section and the V.E. Alternatives is the cost savings associated with the reduced median shoulder thickness (4B) and width (4A & 4B). In addition, there is a reduction in the earthwork with V.E. Alternative 4A because of the reduction of 4 feet in the median width. Since V.E. Alternative 4B maintains the existing outside slopes and ditch section there is a significant reduction in the earthwork quantities.

The total cost comparison of the "As Proposed" and V.E. Alternative Nos. 4A & 4B are summarized as follows.

"As Proposed" Typical Section	$8,248,218
V.E. Alternative No. 4A	$5,768,520
V.E. Alternative No. 4B	$3,713,852

Potential Savings V.E. Alternative No. 4A	$2,479,608
Potential Savings V.E. Alternative No. 4B	$4,534,366

Recommendation

In view of the potential cost savings with V.E. Alternative No. 4B which maintains the outside slopes and ditch section and incorporates a reduced shoulder structural thickness, it is recommended for adoption.

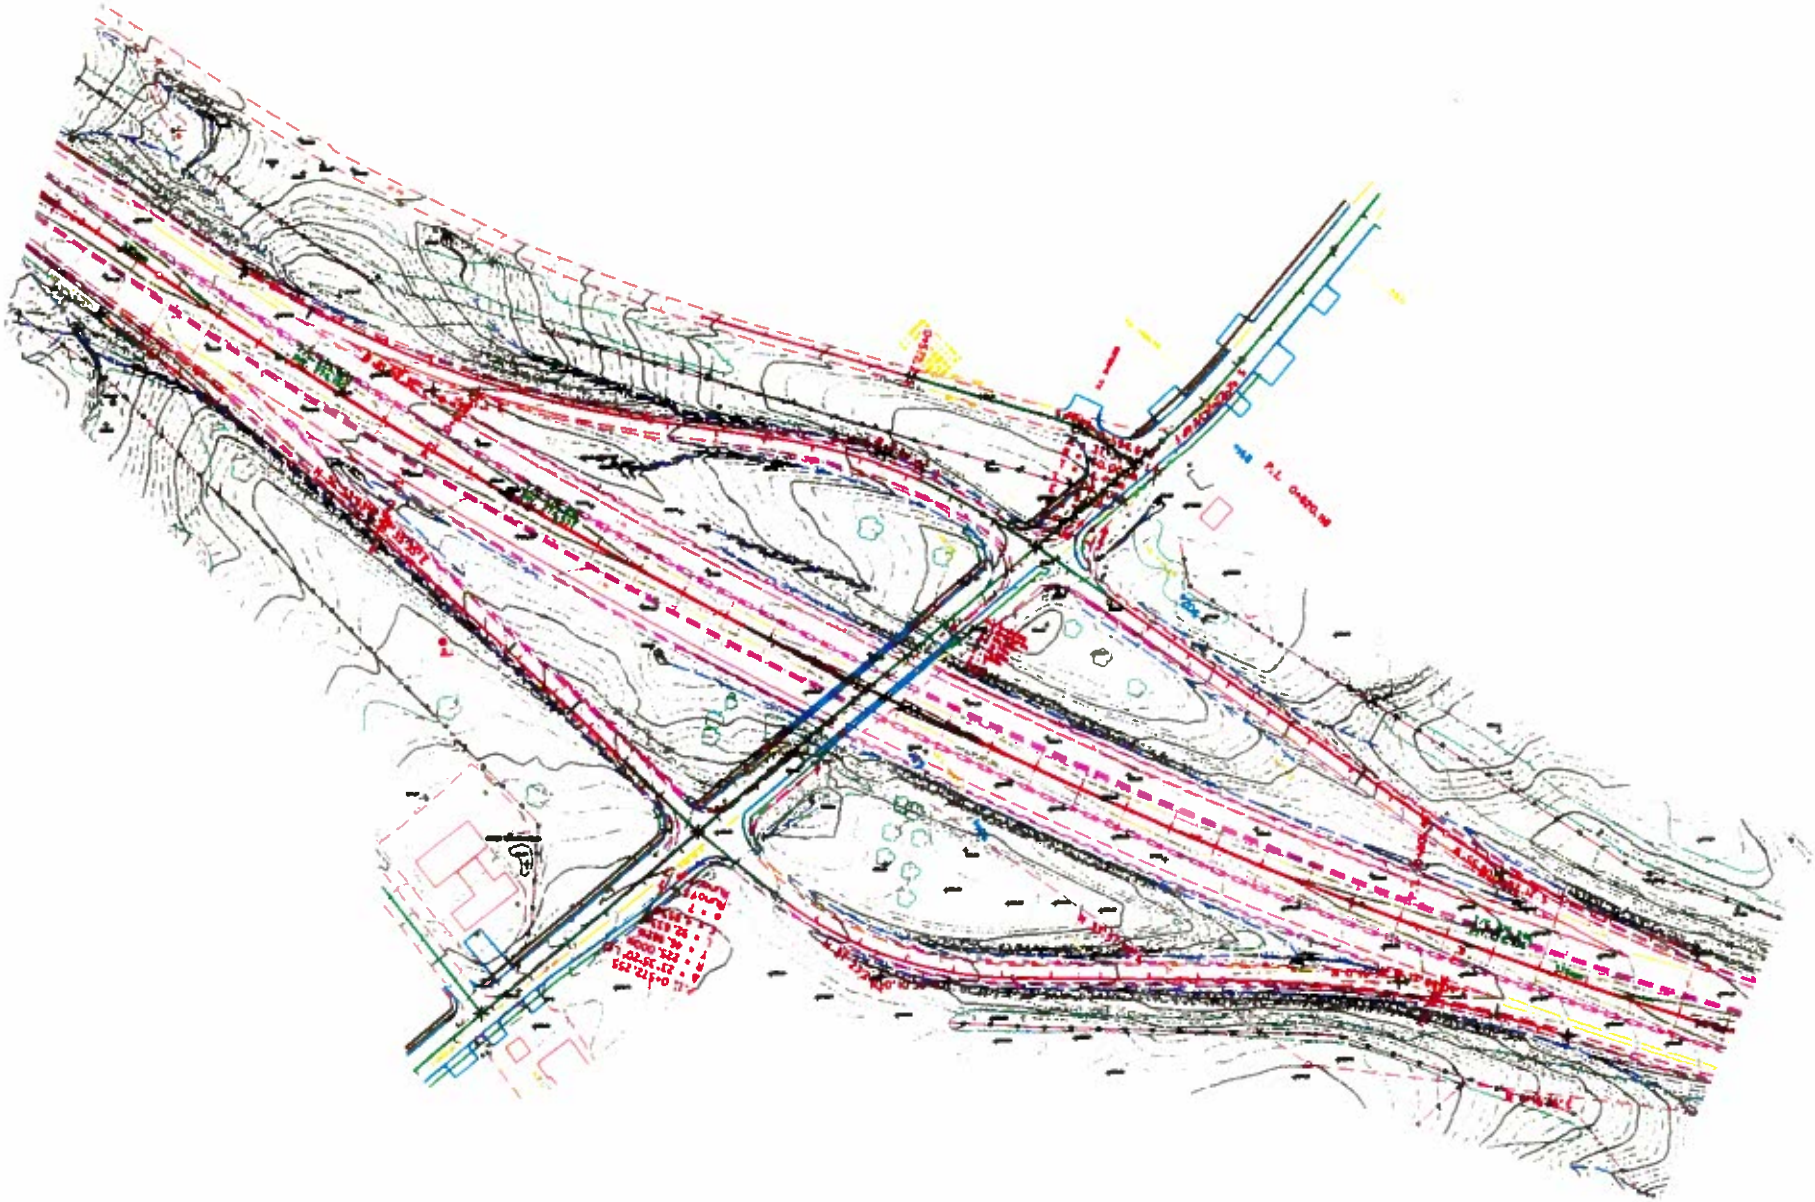
VII.(f) KY 491 STRUCTURE

VII.(f)(1) AS PROPOSED

"As Proposed"

The existing bridge is a four span reinforced concrete deck girder bridge (RCDG). The "As Proposed" is a two span bridge, (31.25m-31.25m) utilizing prestressed concrete Type IV beams and MSE walls. This alternatives maintenance of traffic (MOT) plan utilizes an expensive crossover to divert traffic while the existing bridge is demolitioned and beams are set.



AS PROPOSED

VII.(f)(2) V.E. ALTERNATIVES

V.E. Alternatives

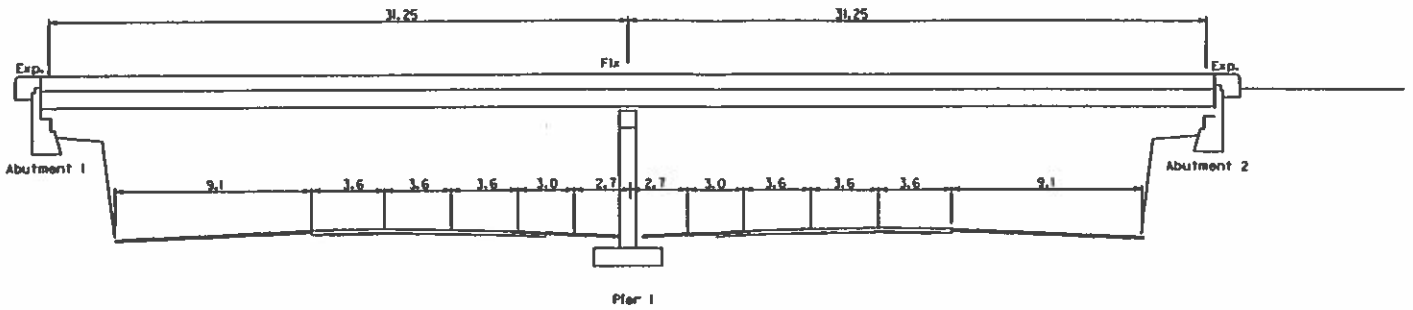
V.E. Alternative No. 1 is to jack the existing bridge and to widen as required to provide the required bridge width. This alternative utilizes the on/off ramps to divert traffic during the minor demolition and beam erection.

This alternative costs $866,799 less than the "As Proposed". This is the recommended alternative.

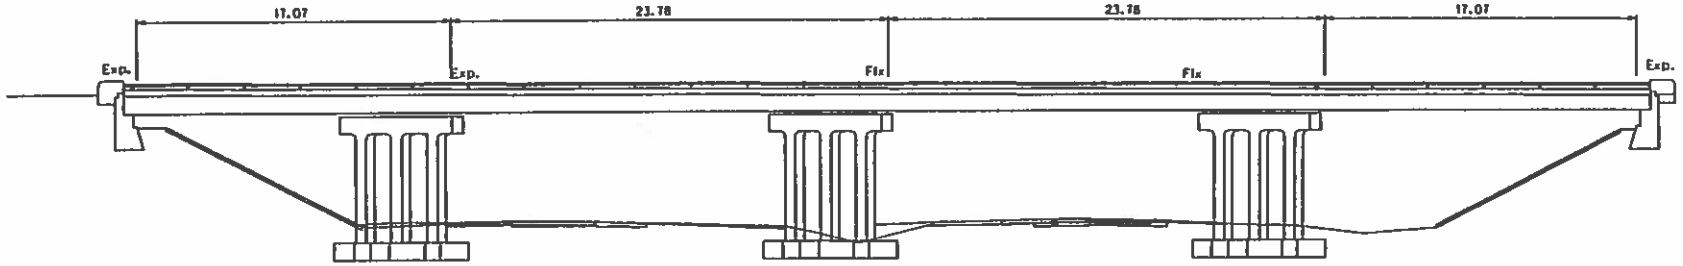
V.E. Alternative No. 2 is to use a two span (23.77m - 23.77m) bridge using prestressed concrete Type III girders and MSE walls. Barriers will be used at the face of the wall. The maintenance of traffic (MOT) plan is to use the on/off ramps to divert I-75 traffic during demolition and beam erection. This alternative costs $562,391 less than the "As Proposed".

V. E. Alternative No. 3 is to use the "As Proposed" bridge, a two span (31.25m - 31.25m) with Type IV girders and MSE walls. The maintenance of traffic (MOT) would be different. The "As Proposed" uses a crossover to divert traffic during demolition and beam erection. The V.E. 3 Alternative's MOT plan will use the on/off ramps to divert traffic. It is expected to divert I-75 traffic a total of twelve nights.

This alternative costs $710,585 less than the "As Proposed".



AS PROPOSED



NEW SUPERSTRUCTURE ON ALTERED SUBSTRUCTURE.

VALUE ENGINEERING ALTERNATIVE

The "As Proposed" KY 491 bridge utilizes a crossover to maintain I-75 traffic during demolition and construction. The estimated cost of the crossover is $521,000. The V.E. proposal is to utilize the on/off ramps at the I-75/KY-491 interchange to detour I-75 traffic. The detours would only be used during off peak hours.

The MOT plan is to restrict the I-75 traffic to one lane and detour the traffic to the off ramp across KY 491 and onto the on ramp proceeding onto I-75. The existing bridge will be removed in sections. The existing bridge will remain in place during construction of the first phase of the new bridge. The existing bridge will be used for maintaining KY-491 traffic. I-75 will be diverted when beams are erected in the new bridge phase 1 construction.

The need for diverting traffic will be as follows:

2 nights to set beams in Phase 1 new bridge
2 nights to cast deck in Phase 1
2 nights/span to demolition existing bridge (total 4 nights)
2 days to set girders in Phase II
2 nights to cast deck in Phase II

Total of 12 nights

It might be considered to include an incentive in the contract for minimizing the time for diverting traffic. Allow a certain amount of time and reward the contractor for using less time. This would minimize traffic constraint and user cost.

VIII. SUMMARY OF RECOMMENDATIONS

SUMMARY OF RECOMMENDATIONS

It is the recommendation of the Value Engineering team that the following Value Engineering Alternatives be carried into the Project Development process for further development.

Recommendation Number 1-Drainage Blanket

The Value Engineering Team recommends that Value Engineering Alternative No. 1 be implemented. This alternative uses an untreated stone blanket.

If this recommendation can be implemented, there is a possible savings of $1,008,735.

Recommendation Number 2-KY 14/16 Structure

The Value Engineering Team recommends that Value Engineering Alternative No. 2 be implemented. This alternative replaces the existing bridge with a new structure but does not use a crossover for maintenance of traffic.

If this recommendation can be implemented, there is a possible savings of $ 461,100.

Recommendation Number 3-KY 14/16 Interchange Ramp Revision and Culvert Extension

The Value Engineering Team recommends that the Value Engineering Alternative be implemented. This alternative changes the proposed ramp revision and eliminates the culvert extension and fill.

If this recommendation can be implemented, there is a possible savings of $ 216,258.

Recommendation Number 4-Mainline Overlay and New Pavement Thickness

The Value Engineering Team recommends that the Value Engineering Alternative be implemented. This alternative minimizes the thickness by revising the pavement design.

If this recommendation can be implemented, there is a possible savings of $1,359,250.

Recommendation Number 5-Typical Section

The Value Engineering Team recommends that Value Engineering Alternative No. 4B be implemented. This alternative uses an 8 meter depressed median, uses a standard height single slope barrier in the median, uses 12'(3.6m) paved shoulders in the median, reduces the thickness of the median shoulder pavement and/or uses lesser grade of materials for the shoulder pavement in the median and feathers the shoulders down from the edge of pavement on the outside and does nothing outside the existing shoulders.

If this recommendation can be implemented, there is a possible savings of **$4,534,366.**

Recommendation Number 6-KY 491 Structure

The Value Engineering Team recommends that Value Engineering Alternative No. 1 be implemented. This alternative salvages the existing bridge by jacking it up to obtain the required vertical clearance and widens the existing bridge to obtain the desired typical section width.

If this recommendation can be implemented, there is a possible savings of **$ 866,800.**

If all the recommendations can be implemented, there is a possible total savings of **$8,446,509.**
